Volume 30

**ALKALI METAL HALATES,  
AMMONIUM IODATE AND  
IODIC ACID**

## SOLUBILITY DATA SERIES

- Volume 1 H. L. Clever, *Helium and Neon*  
Volume 2 H. L. Clever, *Krypton, Xenon and Radon*  
Volume 3 M. Salomon, *Silver Azide, Cyanide, Cyanamides, Cyanate, Selenocyanate and Thiocyanate*  
Volume 4 H. L. Clever, *Argon*  
Volume 5/6 C. L. Young, *Hydrogen and Deuterium*  
Volume 7 R. Battino, *Oxygen and Ozone*  
Volume 8 C. L. Young, *Oxides of Nitrogen*  
Volume 9 W. Hayduk, *Ethane*  
Volume 10 R. Battino, *Nitrogen and Air*  
Volume 11 B. Scrosati and C. A. Vincent, *Alkali Metal, Alkaline Earth Metal and Ammonium Halides. Amide Solvents*  
Volume 12 C. L. Young, *Sulfur Dioxide, Chlorine, Fluorine and Chlorine Oxides*  
Volume 13 S. Siekierski, T. Mioduski and M. Salomon, *Scandium, Yttrium, Lanthanum and Lanthanide Nitrates*  
Volume 14 H. Miyamoto, M. Salomon and H. L. Clever, *Alkaline Earth Metal Halates*  
Volume 15 A. F. M. Barton, *Alcohols with Water*  
Volume 16/17 E. Tomlinson and A. Regosz, *Antibiotics: I.  $\beta$ -Lactam Antibiotics*  
Volume 18 O. Popovych, *Tetraphenylborates*  
Volume 19 C. L. Young, *Cumulative Index: Volumes 1-18*  
Volume 20 A. L. Horvath and F. W. Getzen, *Halogenated Benzenes, Toluenes and Phenols with Water*  
Volume 21 C. L. Young and P. G. T. Fogg, *Ammonia, Amines, Phosphine, Arsine, Stibine, Silane, Germane and Stannane in Organic Solvents*  
Volume 22 T. Mioduski and M. Salomon, *Scandium, Yttrium, Lanthanum and Lanthanide Halides in Nonaqueous Solvents*  
Volume 23 T. P. Dirkse, *Copper, Silver, Gold, and Zinc, Cadmium, Mercury Oxides and Hydroxides*  
Volume 24 W. Hayduk, *Propane, Butane and 2-Methylpropane*  
Volume 25 C. Hirayama, Z. Galus and C. Guminski, *Metals in Mercury*  
Volume 26 M. R. Masson, H. D. Lutz and B. Engelen, *Sulfites, Selenites and Tellurites*  
Volume 27/28 H. L. Clever and C. L. Young, *Methane*  
Volume 29 H. L. Clever, *Mercury in Liquids, Compressed Gases, Molten Salts and Other Elements*  
Volume 30 H. Miyamoto and M. Salomon, *Alkali Metal Halates, Ammonium Iodate and Iodic Acid*

### *Selected Volumes in Preparation*

- E. Tomlinson, *Antibiotics: II. Peptide Antibiotics*  
H. Miyamoto, *Copper and Silver Halates*  
J. W. Lorimer, *Beryllium, Strontium, Barium and Radium Sulfates*  
H. L. Clever and C. L. Young, *Carbon Dioxide*

### NOTICE TO READERS

Dear Reader

If your library is not already a standing-order customer or subscriber to the Solubility Data Series, may we recommend that you place a standing order or subscription order to receive immediately upon publication all new volumes published in this valuable series. Should you find that these volumes no longer serve your needs, your order can be cancelled at any time without notice.

## FOREWORD

*If the knowledge is  
undigested or simply wrong,  
more is not better*

How to communicate and disseminate numerical data effectively in chemical science and technology has been a problem of serious and growing concern to IUPAC, the International Union of Pure and Applied Chemistry, for the last two decades. The steadily expanding volume of numerical information, the formulation of new interdisciplinary areas in which chemistry is a partner, and the links between these and existing traditional subdisciplines in chemistry, along with an increasing number of users, have been considered as urgent aspects of the information problem in general, and of the numerical data problem in particular.

Among the several numerical data projects initiated and operated by various IUPAC commissions, the *Solubility Data Project* is probably one of the most ambitious ones. It is concerned with preparing a comprehensive critical compilation of data on solubilities in all physical systems, of gases, liquids and solids. Both the basic and applied branches of almost all scientific disciplines require a knowledge of solubilities as a function of solvent, temperature and pressure. Solubility data are basic to the fundamental understanding of processes relevant to agronomy, biology, chemistry, geology and oceanography, medicine and pharmacology, and metallurgy and materials science. Knowledge of solubility is very frequently of great importance to such diverse practical applications as drug dosage and drug solubility in biological fluids, anesthesiology, corrosion by dissolution of metals, properties of glasses, ceramics, concretes and coatings, phase relations in the formation of minerals and alloys, the deposits of minerals and radioactive fission products from ocean waters, the composition of ground waters, and the requirements of oxygen and other gases in life support systems.

The widespread relevance of solubility data to many branches and disciplines of science, medicine, technology and engineering, and the difficulty of recovering solubility data from the literature, lead to the proliferation of published data in an ever increasing number of scientific and technical primary sources. The sheer volume of data has overcome the capacity of the classical secondary and tertiary services to respond effectively.

While the proportion of secondary services of the review article type is generally increasing due to the rapid growth of all forms of primary literature, the review articles become more limited in scope, more specialized. The disturbing phenomenon is that in some disciplines, certainly in chemistry, authors are reluctant to treat even those limited-in-scope reviews exhaustively. There is a trend to preselect the literature, sometimes under the pretext of reducing it to manageable size. The crucial problem with such preselection - as far as numerical data are concerned - is that there is no indication as to whether the material was excluded by design or by a less than thorough literature search. We are equally concerned that most current secondary sources, critical in character as they may be, give scant attention to numerical data.

On the other hand, tertiary sources - handbooks, reference books and other tabulated and graphical compilations - as they exist today are comprehensive but, as a rule, uncritical. They usually attempt to cover whole disciplines, and thus obviously are superficial in treatment. Since they command a wide market, we believe that their service to the advancement of science is at least questionable. Additionally, the change which is taking place in the generation of new and diversified numerical data, and the rate at which this is done, is not reflected in an increased third-level service. The emergence of new tertiary literature sources does not parallel the shift that has occurred in the primary literature.

With the status of current secondary and tertiary services being as briefly stated above, the innovative approach of the *Solubility Data Project* is that its compilation and critical evaluation work involve consolidation and reprocessing services when both activities are based on intellectual and scholarly reworking of information from primary sources. It comprises compact compilation, rationalization and simplification, and the fitting of isolated numerical data into a critically evaluated general framework.

The *Solubility Data Project* has developed a mechanism which involves a number of innovations in exploiting the literature fully, and which contains new elements of a more imaginative approach for transfer of reliable information from primary to secondary/tertiary sources. *The fundamental trend of the Solubility Data Project is toward integration of secondary and tertiary services with the objective of producing in-depth critical analysis and evaluation which are characteristic to secondary services, in a scope as broad as conventional tertiary services.*

Fundamental to the philosophy of the project is the recognition that the basic element of strength is the active participation of career scientists in it. Consolidating primary data, producing a truly critically-evaluated set of numerical data, and synthesizing data in a meaningful relationship are demands considered worthy of the efforts of top scientists. Career scientists, who themselves contribute to science by their involvement in active scientific research, are the backbone of the project. The scholarly work is commissioned to recognized authorities, involving a process of careful selection in the best tradition of IUPAC. This selection in turn is the key to the quality of the output. These top experts are expected to view their specific topics dispassionately, paying equal attention to their own contributions and to those of their peers. They digest literature data into a coherent story by weeding out what is wrong from what is believed to be right. To fulfill this task, the evaluator must cover all relevant open literature. No reference is excluded by design and every effort is made to detect every bit of relevant primary source. Poor quality or wrong data are mentioned and explicitly disqualified as such. In fact, it is only when the reliable data are presented alongside the unreliable data that proper justice can be done. The user is bound to have incomparably more confidence in a succinct evaluative commentary and a comprehensive review with a complete bibliography to both good and poor data.

It is the standard practice that the treatment of any given solute-solvent system consists of two essential parts: I. Critical Evaluation and Recommended Values, and II. Compiled Data Sheets.

The Critical Evaluation part gives the following information:

- (i) a verbal text of evaluation which discusses the numerical solubility information appearing in the primary sources located in the literature. The evaluation text concerns primarily the quality of data after consideration of the purity of the materials and their characterization, the experimental method employed and the uncertainties in control of physical parameters, the reproducibility of the data, the agreement of the worker's results on accepted test systems with standard values, and finally, the fitting of data, with suitable statistical tests, to mathematical functions;
- (ii) a set of recommended numerical data. Whenever possible, the set of recommended data includes weighted average and standard deviations, and a set of smoothing equations derived from the experimental data endorsed by the evaluator;
- (iii) a graphical plot of recommended data.

The Compilation part consists of data sheets of the best experimental data in the primary literature. Generally speaking, such independent data sheets are given only to the best and endorsed data covering the known range of experimental parameters. Data sheets based on primary sources where the data are of a lower precision are given only when no better data are available. Experimental data with a precision poorer than considered acceptable are reproduced in the form of data sheets when they are the only known data for a particular system. Such data are considered to be still suitable for some applications, and their presence in the compilation should alert researchers to areas that need more work.

The typical data sheet carries the following information:

- (i) components - definition of the system - their names, formulas and Chemical Abstracts registry numbers;
- (ii) reference to the primary source where the numerical information is reported. In cases when the primary source is a less common periodical or a report document, published though of limited availability, abstract references are also given;
- (iii) experimental variables;
- (iv) identification of the compiler;
- (v) experimental values as they appear in the primary source. Whenever available, the data may be given both in tabular and graphical form. If auxiliary information is available, the experimental data are converted also to SI units by the compiler.

Under the general heading of Auxiliary Information, the essential experimental details are summarized:

- (vi) experimental method used for the generation of data;
- (vii) type of apparatus and procedure employed;
- (viii) source and purity of materials;
- (ix) estimated error;
- (x) references relevant to the generation of experimental data as cited in the primary source.

This new approach to numerical data presentation, formulated at the initiation of the project and perfected as experience has accumulated, has been strongly influenced by the diversity of background of those whom we are supposed to serve. We thus deemed it right to preface the evaluation/compilation sheets in each volume with a detailed discussion of the principles of the accurate determination of relevant solubility data and related thermodynamic information.

Finally, the role of education is more than corollary to the efforts we are seeking. The scientific standards advocated here are necessary to strengthen science and technology, and should be regarded as a major effort in the training and formation of the next generation of scientists and engineers. Specifically, we believe that there is going to be an impact of our project on scientific-communication practices. The quality of consolidation adopted by this program offers down-to-earth guidelines, concrete examples which are bound to make primary publication services more responsive than ever before to the needs of users. The self-regulatory message to scientists of the early 1970s to refrain from unnecessary publication has not achieved much. A good fraction of the literature is still cluttered with poor-quality articles. The Weinberg report (in 'Reader in Science Information', ed. J. Sherrod and A. Hodina, Microcard Editions Books, Indian Head, Inc., 1973, p. 292) states that 'admonition to authors to restrain themselves from premature, unnecessary publication can have little effect unless the climate of the entire technical and scholarly community encourages restraint...' We think that projects of this kind translate the climate into operational terms by exerting pressure on authors to avoid submitting low-grade material. The type of our output, we hope, will encourage attention to quality as authors will increasingly realize that their work will not be suited for permanent retrievability unless it meets the standards adopted in this project. It should help to dispel confusion in the minds of many authors of what represents a permanently useful bit of information of an archival value, and what does not.

If we succeed in that aim, even partially, we have then done our share in protecting the scientific community from unwanted and irrelevant, wrong numerical information.

A. S. Kertes

## PREFACE

The present volume is the second of four volumes planned for inorganic metal halates. The first, on *ALKALINE EARTH METAL HALATES*, was published in 1983 (1), and two more volumes, on copper and silver halates, and on transition and rare earth metal halates are in course of preparation.

The alkali and alkaline earth metal halates have an important place in the history of both theoretical and practical analytical chemistry. In 1848, Berthelot, in France, described the use of potassium iodate as a standard titrant for the determination of iodide, and the well established method for determining phenol with excess bromate-bromine reagent in acid solution was first described by Knop in 1845, and further developed by Koppeschaar in 1875. Important practical applications of halate chemistry include their use in pyrotechnics, and in the paper pulp industry for the generation of chloric dioxide bleaching agent.

In spite of the long history on the chemistry of alkali metal halates, the reader will discover that there are still considerable uncertainties in the nature of solid phases and transition temperatures for a number of systems: e.g. we can cite the binary systems  $\text{LiIO}_3 - \text{H}_2\text{O}$  and  $\text{HIO}_3 - \text{H}_2\text{O}$ . Hopefully, this volume will serve as a guide for future studies on these systems.

The literature of the solubilities of alkali metal halates was covered through the first half of 1984, and we believe this survey to be complete. In a few instances, relevant papers were not compiled since it was not possible to obtain either reprints or other reproductions of the original publication. We were, for example, unable to obtain the paper in Ref. (2), and this publication was omitted from this volume. A number of publications were not compiled or referred to in the critical evaluations for a variety of reasons. In Ref. (3),  $\text{KClO}_3$  was stated to be "appreciably soluble" in liquid  $\text{SO}_2$ , and in Ref. (4) only partial phase diagrams were given for several ternary  $\text{NaClO}_3$  systems with no numerical solubility data. Some publications dealing with solubilities in non-aqueous solvents were not compiled as the authors stated various alkali metal halates were "insoluble" (5-7) without providing numerical information.

To arrive at either *recommended* or *tentative* solubility values, we generally applied a statistical treatment similar to that recommended by Cohen-Adad (8) based on the thermodynamic treatment of saturated solutions and their equilibrated solid phases (8-10) as discussed in the *INTRODUCTION TO THE SOLUBILITY OF SOLIDS IN LIQUIDS* found in this volume. These thermodynamic treatments show that for binary systems, solubilities over the complete range of ice as the solid phase to the melting of the pure solute can be expressed by

$$Y = A/(T/K) + B \ln (T/K) + C + D(T/K) \quad [1]$$

The complex Y term in eq. [1] takes different forms depending upon the concentration units employed. In the present volume, the evaluators have analyzed solubilities based on mole fraction and mass units, and in terms of mole fraction units, the complex Y term (called  $Y_x$  throughout this volume) is given by (8-10).

$$Y_x = \ln \left\{ \chi^{v(1-x)r(v+r)^{v+r}} / \left( r^r(1+\chi)^{v+r} \right) \right\} \quad [2]$$

where r is the solvation number in the solid phase, v is the number of ions produced upon dissolution, and  $\chi$  is the mole fraction solubility. When sufficient data were available, the evaluators used eq. [2] in a four parameter fit to eq. [1]: note that for the ice polytherm,  $v = 0$  and  $r = 1$ .

For solubilities expressed in  $\text{mol kg}^{-1}$  units, the evaluators used a simpler form of Y referred to as  $Y_m$  throughout this volume.  $Y_m$  is given by (see 8-11 and the *INTRODUCTION* to this volume):

$$Y_m = \ln (m/m_0) - rM(m - m_0) \quad [3]$$

where r is the solvation number of the solid, m is the molality of the saturated solution,  $m_0$  is an arbitrarily selected reference molality (usually the molality at 298 K), and M is the molar mass of the solvent. When fitting the  $Y_m$  terms to eq. [1], the evaluators generally used a three parameter fit (i.e. the constants A, B and C were evaluated).

In fitting the solubility data for binary systems to the smoothing eq. [1], the evaluators rejected a number of data points based on the deviation from the standard error of estimate,  $\sigma$ : that is, when the difference between calculated and observed solubilities exceeded  $2\sigma$ , the data point was rejected. For mole fraction solubilities, the standard error of estimate,  $\sigma_x$  is defined by:

$$\sigma_x = \left\{ \sum (x_{\text{obsd}} - x_{\text{calcd}}) / (N - 4) \right\}^{1/2} \quad [4]$$

where N is the number of data points associated with the particular polytherm being considered. A similar relation exists for the standard error of estimate for mol kg<sup>-1</sup> solubilities,  $\sigma_m$ , but the evaluators used (N - 3) in the denominator since  $Y_m$  values were fitted to a three constant smoothing equation. In addition to reporting the standard errors  $\sigma_x$  and  $\sigma_m$ , the evaluators also reported the standard errors for the Y terms ( $Y_x$  and  $Y_m$ ), denoted simply as  $\sigma_y$  in the evaluations.

For convenience of the users, the evaluators have prepared two computer programs written in BASIC to calculate the solubilities at any temperature. The programs called "CALC\_X" and "CALC\_M" are given on the pages following the references. Note that the user is requested to enter an initial estimate of the solubility to start the calculations. Since the Newton-Raphson iteration method is used, the user should be aware that a very poor initial estimate of the solubility may result in convergence at an incorrect answer. Finally, we should like to point out that both programs use double precision in the calculations (statement number 20 in both programs: DEFDBL A-H, O-Z). Using IBM-PC or compatibles with MS-BASIC, double precision is required to give at least 8-bit numerical precision.

Although an attempt has been made to locate all publications on the system under consideration through the first half of 1984, some omissions may have occurred. The editors will therefore be grateful to readers who will bring these omissions to their attention.

The editors would like to acknowledge the cooperation of the American Chemical Society and VAAP, the copyright agency of the USSR, for their permission to reproduce phase diagrams from their publications.

The editors gratefully acknowledge the advice and comments from members of IUPAC Commission V.8 (the Commission on Solubility Data), and in particular to Professors H. L. Clever, R. Cohen-Adad, J. W. Lorimer, and A. S. Kertes. We are also grateful to Dr. K. Loening of the Chemical Abstracts Service for providing Registry Numbers for numerous compounds.

One of us (H.M.) would also like to acknowledge the hospitality of Prof. H. L. Clever during his stay at the Solubility Research and Information Center at Emory University in Atlanta, GA, USA (1981-1982), and to Profs. Hideo Akaiwa (Gunma University) and Michihiro Fujii (Niigata University) for valuable comments and suggestions. We would also like to thank Ms. Karen Salomon for her help in translations. Finally the editors would like to thank Mrs. Shikako Miyamoto for her assistance with the tedious calculations of converting experimental solubility data in mass % units to S.I. units.

# INTRODUCTION TO THE SOLUBILITY OF SOLIDS IN LIQUIDS

## Nature of the Project

The Solubility Data Project (SDP) has as its aim a comprehensive search of the literature for solubilities of gases, liquids, and solids in liquids or solids. Data of suitable precision are compiled on data sheets in a uniform format. The data for each system are evaluated, and where data from different sources agree sufficiently, recommended values are proposed. The evaluation sheets, recommended values, and compiled data sheets are published on consecutive pages.

## Definitions

A mixture (1, 2) describes a gaseous, liquid, or solid phase containing more than one substance, when the substances are all treated in the same way.

A solution (1, 2) describes a liquid or solid phase containing more than one substance, when for convenience one of the substances, which is called the solvent, and may itself be a mixture, is treated differently than the other substances, which are called solutes. If the sum of the mole fractions of the solutes is small compared to unity, the solution is called a dilute solution.

The solubility of a substance B is the relative proportion of B (or a substance related chemically to B) in a mixture which is saturated with respect to solid B at a specified temperature and pressure. Saturated implies the existence of equilibrium with respect to the processes of dissolution and precipitation; the equilibrium may be stable or metastable. The solubility of a substance in metastable equilibrium is usually greater than that of the corresponding substance in stable equilibrium. (Strictly speaking, it is the activity of the substance in metastable equilibrium that is greater.) Care must be taken to distinguish true metastability from supersaturation, where equilibrium does not exist.

Either point of view, mixture or solution, may be taken in describing solubility. The two points of view find their expression in the quantities used as measures of solubility and in the reference states used for definition of activities, activity coefficients and osmotic coefficients.

The qualifying phrase "substance related chemically to B" requires comment. The composition of the saturated mixture (or solution) can be described in terms of any suitable set of thermodynamic components. Thus, the solubility of a salt hydrate in water is usually given as the relative proportion of anhydrous salt in solution, rather than the relative proportions of hydrated salt and water.

## Quantities Used as Measures of Solubility

1. Mole fraction of substance B,  $x_B$ :

$$x_B = n_B / \sum_{s=1}^c n_s \quad [1]$$

where  $n_s$  is the amount of substance of  $s$ , and  $c$  is the number of distinct substances present (often the number of thermodynamic components in the system). Mole per cent of B is  $100 x_B$ .

2. Mass fraction of substance B,  $w_B$ :

$$w_B = m_B' / \sum_{s=1}^c m_s' \quad [2]$$

where  $m_s'$  is the mass of substance  $s$ . Mass per cent is  $100 w_B$ . The equivalent terms weight fraction and weight per cent are not used.

3. Solute mole (mass) fraction of solute B (3, 4):

$$x_{s,B} = m_B / \sum_{s=1}^{c'} m_s = x_B / \sum_{s=1}^{c'} x_s \quad [3]$$

$$w_{s,B} = m_B' / \sum_{s=1}^{c'} m_s' = w_B / \sum_{s=1}^{c'} w_s \quad [3a]$$

where the summation is over the solutes only. For the solvent A,  $x_{S,A} = x_A/(1 - x_A)$ ,  $w_{S,A} = w_A/(1 - w_A)$ . These quantities are called Jänecke mole (mass) fractions in many papers.

4. Molality of solute B (1, 2) in a solvent A:

$$m_B = n_B/n_A M_A \quad \text{SI base units: mol kg}^{-1} \quad [4]$$

where  $M_A$  is the molar mass of the solvent.

5. Concentration of solute B (1, 2) in a solution of volume V:

$$c_B = [B] = n_B/V \quad \text{SI base units: mol m}^{-3} \quad [5]$$

The symbol  $c_B$  is preferred to  $[B]$ , but both are used. The terms molarity and molar are not used.

Mole and mass fractions are appropriate to either the mixture or the solution point of view. The other quantities are appropriate to the solution point of view only. Conversions among these quantities can be carried out using the equations given in Table I-1 following this Introduction. Other useful quantities will be defined in the prefaces to individual volumes or on specific data sheets.

In addition to the quantities defined above, the following are useful in conversions between concentrations and other quantities.

6. Density:  $\rho = m/V$  SI base units:  $\text{kg m}^{-3}$  [6]

7. Relative density:  $d$ ; the ratio of the density of a mixture to the density of a reference substance under conditions which must be specified for both (1). The symbol  $d_t$  will be used for the density of a mixture at  $t^\circ\text{C}$ , 1 bar divided by the density of water at  $t^\circ\text{C}$ , 1 bar. (In some cases 1 atm = 101.325 kPa is used instead of 1 bar = 100 kPa.)

8. A note on nomenclature. The above definitions use the nomenclature of the IUPAC Green Book (1), in which a solute is called B and a solvent A. In compilations and evaluations, the first-named component (component 1) is the solute, and the second (component 2 for a two-component system) is the solvent. The reader should bear these distinctions in nomenclature in mind when comparing nomenclature and theoretical equations given in this Introduction with equations and nomenclature used on the evaluation and compilation sheets.

### Thermodynamics of Solubility

The principal aims of the Solubility Data Project are the tabulation and evaluation of: (a) solubilities as defined above; (b) the nature of the saturating phase. Thermodynamic analysis of solubility phenomena has two aims: (a) to provide a rational basis for the construction of functions to represent solubility data; (b) to enable thermodynamic quantities to be extracted from solubility data. Both these are difficult to achieve in many cases because of a lack of experimental or theoretical information concerning activity coefficients. Where thermodynamic quantities can be found, they are not evaluated critically, since this task would involve critical evaluation of a large body of data that is not directly relevant to solubility. The following is an outline of the principal thermodynamic relations encountered in discussions of solubility. For more extensive discussions and references, see books on thermodynamics, e.g., (5-12).

#### Activity Coefficients (1)

(a) Mixtures. The activity coefficient  $f_B$  of a substance B is given by

$$RT \ln (f_B x_B) = \mu_B - \mu_B^* \quad [7]$$

where  $\mu_B^*$  is the chemical potential of pure B at the same temperature and pressure. For any substance B in the mixture,

$$\lim_{x_B \rightarrow 1} f_B = 1 \quad [8]$$

(b) Solutions.

(1) Solute B. The molal activity coefficient  $\gamma_B$  is given by

$$RT \ln (\gamma_B m_B) = \mu_B - (\mu_B - RT \ln m_B)^\infty \quad [9]$$

where the superscript  $\infty$  indicates an infinitely dilute solution. For any solute B,

$$\gamma_B^\infty = 1 \quad [10]$$

Activity coefficients  $y_B$  connected with concentrations  $c_B$ , and  $f_{x,B}$  (called the rational activity coefficient) connected with mole fractions  $x_B$  are defined in analogous ways. The relations among them are (1, 9), where  $\rho^*$  is the density of the pure solvent:

$$f_B = (1 + M_A \sum_S m_S) \gamma_B = [\rho + \sum_S (M_A - M_S) c_S] y_B / \rho^* \quad [11]$$

$$\gamma_B = (1 - \sum_S x_S) f_{x,B} = (\rho - \sum_S M_S c_S) y_B / \rho^* \quad [12]$$

$$y_B = \rho^* f_{x,B} [1 + \sum_S (M_S / M_A - 1) x_S] / \rho = \rho^* (1 + \sum_S M_S m_S) \gamma_B / \rho \quad [13]$$

For an electrolyte solute  $B = C_{\nu_+} A_{\nu_-}$ , the activity on the molality scale is replaced by (9)

$$\gamma_{Bm} = \gamma_{\pm}^{\nu} m_B^{\nu} Q^{\nu} \quad [14]$$

where  $\nu = \nu_+ + \nu_-$ ,  $Q = (\nu_+^{\nu_+} \nu_-^{\nu_-})^{1/\nu}$ , and  $\gamma_{\pm}$  is the mean ionic activity coefficient on the molality scale. A similar relation holds for the concentration activity,  $y_{BC}$ . For the mole fractional activity,

$$f_{x,B} x_B = Q^{\nu} f_{\pm}^{\nu} x_{\pm}^{\nu} \quad [15]$$

where  $x_{\pm} = (x_+ x_-)^{1/\nu}$ . The quantities  $x_+$  and  $x_-$  are the ionic mole fractions (9), which are

$$x_+ = \nu_+ x_B / [1 + \sum_S (\nu_S - 1) x_S]; \quad x_- = \nu_- x_B / [1 + \sum_S (\nu_S - 1) x_S] \quad [16]$$

where  $\nu_S$  is the sum of the stoichiometric coefficients for the ions in a salt with mole fraction  $x_S$ . Note that the mole fraction of solvent is now

$$x_A' = (1 - \sum_S \nu_S x_S) / [1 + \sum_S (\nu_S - 1) x_S] \quad [17]$$

so that

$$x_A' + \sum_S \nu_S x_S = 1 \quad [18]$$

The relations among the various mean ionic activity coefficients are:

$$f_{\pm} = (1 + M_A \sum_S \nu_S m_S) \gamma_{\pm} = [\rho + \sum_S (\nu_S M_A - M_S) c_S] y_{\pm} / \rho^* \quad [19]$$

$$\gamma_{\pm} = \frac{(1 - \sum_S x_S) f_{\pm}}{1 + \sum_S (\nu_S - 1) x_S} = (\rho - \sum_S M_S c_S) y_{\pm} / \rho^* \quad [20]$$

$$y_{\pm} = \frac{\rho^* [1 + \sum_S (M_S / M_A - 1) x_S] f_{\pm}}{\rho [1 + \sum_S (\nu_S - 1) x_S]} = \rho^* (1 + \sum_S M_S m_S) \gamma_{\pm} / \rho \quad [21]$$

(11) Solvent, A:

The osmotic coefficient,  $\phi$ , of a solvent A is defined as (1):

$$\phi = (\mu_A^* - \mu_A) / RT M_A \sum_S m_S \quad [22]$$

where  $\mu_A^*$  is the chemical potential of the pure solvent.

The rational osmotic coefficient,  $\phi_x$ , is defined as (1):

$$\phi_x = (\mu_A - \mu_A^*) / RT \ln x_A = \phi M_A \sum_S m_S / \ln(1 + M_A \sum_S m_S) \quad [23]$$

The activity,  $a_A$ , or the activity coefficient,  $f_A$ , is sometimes used for the solvent rather than the osmotic coefficient. The activity coefficient is defined relative to pure A, just as for a mixture.

For a mixed solvent, the molar mass in the above equations is replaced by the average molar mass; i.e., for a two-component solvent with components J, K,  $M_A$  becomes

$$M_A = M_J + (M_K - M_J) x_{v,K} \quad [24]$$

where  $x_{v,K}$  is the solvent mole fraction of component K.

The osmotic coefficient is related directly to the vapor pressure,  $p$ , of a solution in equilibrium with vapor containing A only by (12, p.306):

$$\phi M_A \sum_S \nu_S m_S = - \ln(p/p_A^*) + (V_{m,A}^* - B_{AA})(p - p_A^*) / RT \quad [25]$$

where  $p_A^*$ ,  $V_{m,A}^*$  are the vapor pressure and molar volume of pure solvent A, and  $B_{AA}$  is the second virial coefficient of the vapor.

### The Liquid Phase

A general thermodynamic differential equation which gives solubility as a function of temperature, pressure and composition can be derived. The approach is similar to that of Kirkwood and Oppenheim (7); see also (11, 12). Consider a solid mixture containing  $c$  thermodynamic components 1. The Gibbs-Duhem equation for this mixture is:

$$\sum_{i=1}^c x_i' (S_i' dT - V_i' dp + d\mu_i') = 0 \quad [26]$$

A liquid mixture in equilibrium with this solid phase contains  $c'$  thermodynamic components 1, where  $c' > c$ . The Gibbs-Duhem equation for the liquid mixture is:

$$\sum_{i=1}^c x_i (S_i dT - V_i dp + d\mu_i') + \sum_{i=c+1}^{c'} x_i (S_i dT - V_i dp + d\mu_i) = 0 \quad [27]$$

Subtract [26] from [27] and use the equation

$$d\mu_i = (d\mu_i)_{T,p} - S_i dT + V_i dp \quad [28]$$

and the Gibbs-Duhem equation at constant temperature and pressure:

$$\sum_{i=1}^c x_i (d\mu_i')_{T,p} + \sum_{i=c+1}^{c'} x_i (d\mu_i)_{T,p} = 0 \quad [29]$$

The resulting equation is:

$$RT \sum_{i=1}^c x_i' (d \ln a_i)_{T,p} = \sum_{i=1}^c x_i' (H_i - H_i') dT/T - \sum_{i=1}^c x_i' (V_i - V_i') dp \quad [30]$$

where

$$H_i - H_i' = T(S_i - S_i') \quad [31]$$

is the enthalpy of transfer of component 1 from the solid to the liquid phase at a given temperature, pressure and composition, with  $H_i$  and  $S_i$  the partial molar enthalpy and entropy of component  $i$ .

Use of the equations

$$H_i - H_i^0 = -RT^2 (\partial \ln a_i / \partial T)_{x,p} \quad [32]$$

and

$$V_i - V_i^0 = RT (\partial \ln a_i / \partial p)_{x,T} \quad [33]$$

where superscript 0 indicates an arbitrary reference state gives:

$$RT \sum_{i=1}^c x_i' d \ln a_i = \sum_{i=1}^c x_i' (H_i^0 - H_i') dT/T - \sum_{i=1}^c x_i' (V_i^0 - V_i') dp \quad [34]$$

where

$$d \ln a_i = (d \ln a_i)_{T,p} + (\partial \ln a_i / \partial T)_{x,p} dT + (\partial \ln a_i / \partial p)_{x,T} dp \quad [35]$$

The terms involving enthalpies and volumes in the solid phase can be written as:

$$\sum_{i=1}^c x_i' H_i' = H_S^* \quad \sum_{i=1}^c x_i' V_i' = V_S^* \quad [36]$$

With eqn [36], the final general solubility equation may then be written:

$$RT \sum_{i=1}^c x_i' d \ln a_i = (H_S^* - \sum_{i=1}^c x_i' H_i^0) d(1/T) - (V_S^* - \sum_{i=1}^c x_i' V_i^0) dp/T \quad [37]$$

Note that those components which are not present in both phases do not appear in the solubility equation. However, they do affect the solubility through their effect on the activities of the solutes.

Several applications of eqn [37] (all with pressure held constant) will be discussed below. Other cases will be discussed in individual evaluations.

(a) Solubility as a function of temperature.

Consider a binary solid compound  $A_n B$  in a single solvent A. There is

no fundamental thermodynamic distinction between a binary compound of A and B which dissociates completely or partially on melting and a solid mixture of A and B; the binary compound can be regarded as a solid mixture of constant composition. Thus, with  $c = 2$ ,  $x_A' = n/(n + 1)$ ,  $x_B' = 1/(n + 1)$ , eqn [37] becomes:

$$d \ln(a_A^n a_B) = -\Delta H_{AB}^0 d(1/RT) \quad [38]$$

where

$$\Delta H_{AB}^0 = nH_A + H_B - (n + 1)H_S^* \quad [39]$$

is the molar enthalpy of melting and dissociation of pure solid  $A_nB$  to form A and B in their reference states. Integration between  $T$  and  $T_0$ , the melting point of the pure binary compound  $A_nB$ , gives:

$$\ln(a_A^n a_B) = \ln(a_A^n a_B)_{T=T_0} - \int_{T_0}^T \Delta H_{AB}^0 d(1/RT) \quad [40]$$

#### (1) Non-electrolytes

In eqn [32], introduce the pure liquids as reference states. Then, using a simple first-order dependence of  $\Delta H_{AB}^*$  on temperature, and assuming that the activity coefficients conform to those for a simple mixture (6):

$$RT \ln f_A = wx_B^2 \quad RT \ln f_B = wx_A^2 \quad [41]$$

then, if  $w$  is independent of temperature, eqn [32] and [33] give:

$$\ln(x_B(1-x_B)^n) + \ln\left\{\frac{n^n}{(1+n)^{n+1}}\right\} = G(T) \quad [42]$$

where

$$G(T) = - \left\{ \frac{\Delta H_{AB}^* - T^* \Delta C_p^*}{R} \right\} \left\{ \frac{1}{T} - \frac{1}{T^*} \right\} + \frac{\Delta C_p^*}{R} \ln(T/T^*) - \frac{w}{R} \left\{ \frac{x_A^2 + nx_B^2}{T} - \frac{n}{(n+1)T^*} \right\} \quad [43]$$

where  $\Delta C_p^*$  is the change in molar heat capacity accompanying fusion plus decomposition of the pure compound to pure liquid A and B at temperature  $T^*$ , (assumed here to be independent of temperature and composition), and  $\Delta H_{AB}^*$  is the corresponding change in enthalpy at  $T = T^*$ . Equation [42] has the general form:

$$\ln(x_B(1-x_B)^n) = A_1 + A_2/(T/K) + A_3 \ln(T/K) + A_4(x_A^2 + nx_B^2)/(T/K) \quad [44]$$

If the solid contains only component B, then  $n = 0$  in eqn [42] to [44].

If the infinite dilution reference state is used, then:

$$RT \ln f_{x,B} = w(x_A^2 - 1) \quad [45]$$

and [39] becomes

$$\Delta H_{AB}^\infty = nH_A^* + H_B^\infty - (n + 1)H_S^* \quad [46]$$

where  $\Delta H_{AB}^\infty$  is the enthalpy of melting and dissociation of solid compound  $A_nB$  to the infinitely dilute reference state of solute B in solvent A;  $H_A^*$  and  $H_B^\infty$  are the partial molar enthalpies of the solute and solvent at infinite dilution. Clearly, the integral of eqn [32] will have the same form as eqn [35], with  $\Delta H_{AB}^\infty$  replacing  $\Delta H_{AB}^*$ ,  $\Delta C_p^\infty$  replacing  $\Delta C_p^*$ , and  $x_A^2 - 1$  replacing  $x_A^2$  in the last term.

See (5) and (11) for applications of these equations to experimental data.

#### (1i) Electrolytes

##### (a) Mole fraction scale

If the liquid phase is an aqueous electrolyte solution, and the solid is a salt hydrate, the above treatment needs slight modification. Using rational mean activity coefficients, eqn [34] becomes:

$$\ln\left\{\frac{x_B^{\nu}(1-x_B)^n}{[1+(\nu-1)x_B]^{n+\nu}}\right\} - \ln\left\{\frac{n^n}{(n+\nu)^{n+\nu}}\right\} + \ln\left\{\left[\frac{f_{B^*}}{f_{A^*}}\right]^{\nu}\left[\frac{f_{A^*}}{f_{B^*}}\right]^n\right\} \quad [47]$$

$$- \frac{[\Delta H_{AB}^* - T^* \Delta C_p^*]}{R} \left\{-\frac{1}{T} - \frac{1}{T^*}\right\} + \frac{\Delta C_p^*}{R} \ln(T/T^*)$$

where superscript \* indicates the pure salt hydrate. If it is assumed that the activity coefficients follow the same temperature dependence as the right-hand side of eqn [47] (13-16), the thermochemical quantities on the right-hand side of eqn [47] are not rigorous thermodynamic enthalpies and heat capacities, but are apparent quantities only. Data on activity coefficients (9) in concentrated solutions indicate that the terms involving these quantities are not negligible, and their dependence on temperature and composition along the solubility-temperature curve is a subject of current research.

A similar equation (with  $\nu = 2$  and without the heat capacity terms or activity coefficients) has been used to fit solubility data for some MOH-H<sub>2</sub>O systems, where M is an alkali metal (13); enthalpy values obtained agreed well with known values. The full equation has been deduced by another method in (14) and applied to MCl<sub>2</sub>-H<sub>2</sub>O systems in (14) and (15). For a summary of the use of equation [47] and similar equations, see (14).

## (2) Molality scale

Substitution of the mean activities on the molality scale in eqn [40] gives:

$$\nu \ln \left[ \frac{\gamma_{\pm} m_B}{\gamma_{\pm}^* m_B^*} \right] - \nu (m_B/m_B^* - 1) - \nu (m_B(\phi - 1)/m_B^* - \phi^* + 1) \quad [48]$$

$$= G(T)$$

where  $G(T)$  is the same as in eqn [47],  $m_B^* = 1/nM_A$  is the molality of the anhydrous salt in the pure salt hydrate and  $\gamma_{\pm}$  and  $\phi$  are the mean activity coefficient and the osmotic coefficient, respectively. Use of the osmotic coefficient for the activity of the solvent leads, therefore, to an equation that has a different appearance to [47]; the content is identical. However, while eqn [47] can be used over the whole range of composition ( $0 \leq x_B \leq 1$ ), the molality in eqn [48] becomes infinite at  $x_B = 1$ ; use of eqn [48] is therefore confined to solutions sufficiently dilute that the molality is a useful measure of composition. The essentials of eqn [48] were deduced by Williamson (17); however, the form used here appears first in the *Solubility Data Series*. For typical applications (where activity and osmotic coefficients are not considered explicitly, so that the enthalpies and heat capacities are apparent values, as explained above), see (18).

The above analysis shows clearly that a rational thermodynamic basis exists for functional representation of solubility-temperature curves in two-component systems, but may be difficult to apply because of lack of experimental or theoretical knowledge of activity coefficients and partial molar enthalpies. Other phenomena which are related ultimately to the stoichiometric activity coefficients and which complicate interpretation include ion pairing, formation of complex ions, and hydrolysis. Similar considerations hold for the variation of solubility with pressure, except that the effects are relatively smaller at the pressures used in many investigations of solubility (5).

## (b) Solubility as a function of composition.

At constant temperature and pressure, the chemical potential of a saturating solid phase is constant:

$$\begin{aligned} \mu_{A_n B^*} &= \mu_{A_n B}(\text{sln}) = n\mu_A + \mu_B \quad [49] \\ &= (n\mu_A^* + \nu_+ \mu_+^{\infty} + \nu_- \mu_-^{\infty}) + nRT \ln f_A x_A \\ &\quad + \nu RT \ln(\gamma_{\pm} m_{\pm} Q) \end{aligned}$$

for a salt hydrate  $A_n B$  which dissociates to water (A), and a salt (B), one mole of which ionizes to give  $\nu_+$  cations and  $\nu_-$  anions in a solution in which other substances (ionized or not) may be present. If the saturated solution is sufficiently dilute,  $f_A = x_A = 1$ , and the quantity  $K_S$  in

$$\begin{aligned} \Delta G^{\infty} &= (\nu_+ \mu_+^{\infty} + \nu_- \mu_-^{\infty} + n\mu_A^* - \mu_{AB}^*) \\ &= -RT \ln K_S \end{aligned}$$

$$= -\nu RT \ln(Q\gamma_{\pm}m_B) \quad [50]$$

is called the solubility product of the salt. (It should be noted that it is not customary to extend this definition to hydrated salts, but there is no reason why they should be excluded.) Values of the solubility product are often given on mole fraction or concentration scales. In dilute solutions, the theoretical behaviour of the activity coefficients as a function of ionic strength is often sufficiently well known that reliable extrapolations to infinite dilution can be made, and values of  $K_S$  can be determined. In more concentrated solutions, the same problems with activity coefficients that were outlined in the section on variation of solubility with temperature still occur. If these complications do not arise, the solubility of a hydrate salt  $C_{\nu}A_{\nu} \cdot nH_2O$  in the presence of other solutes is given by eqn [50] as

$$\nu \ln(m_B/m_B(0)) - \nu \ln(\gamma_{\pm}/\gamma_{\pm}(0)) - n \ln(a_A/a_A(0)) \quad [51]$$

where  $a_A$  is the activity of water in the saturated solution,  $m_B$  is the molality of the salt in the saturated solution, and (0) indicates absence of other solutes. Similar considerations hold for non-electrolytes.

Consideration of complex mixed ligand equilibria in the solution phase are also frequently of importance in the interpretation of solubility equilibria. For nomenclature connected with these equilibria (and solubility equilibria as well), see (19, 20).

### The Solid Phase

The definition of solubility permits the occurrence of a single solid phase which may be a pure anhydrous compound, a salt hydrate, a non-stoichiometric compound, or a solid mixture (or solid solution, or "mixed crystals"), and may be stable or metastable. As well, any number of solid phases consistent with the requirements of the phase rule may be present. Metastable solid phases are of widespread occurrence, and may appear as polymorphic (or allotropic) forms or crystal solvates whose rate of transition to more stable forms is very slow. Surface heterogeneity may also give rise to metastability, either when one solid precipitates on the surface of another, or if the size of the solid particles is sufficiently small that surface effects become important. In either case, the solid is not in stable equilibrium with the solution. See (21) for the modern formulation of the effect of particle size on solubility. The stability of a solid may also be affected by the atmosphere in which the system is equilibrated.

Many of these phenomena require very careful, and often prolonged, equilibration for their investigation and elimination. A very general analytical method, the "wet residues" method of Schreinemakers (22), is often used to investigate the composition of solid phases in equilibrium with salt solutions. This method has been reviewed in (23), where [see also (24)] least-squares methods for evaluating the composition of the solid phase from wet residue data (or initial composition data) and solubilities are described. In principle, the same method can be used with systems of other types. Many other techniques for examination of solids, in particular X-ray, optical, and thermal analysis methods, are used in conjunction with chemical analyses (including the wet residues method).

### COMPILATIONS AND EVALUATIONS

The formats for the compilations and critical evaluations have been standardized for all volumes. A brief description of the data sheets has been given in the FOREWORD; additional explanation is given below.

#### Guide to the Compilations

The format used for the compilations is, for the most part, self-explanatory. The details presented below are those which are not found in the FOREWORD or which are not self-evident.

**Components.** Each component is listed according to IUPAC name, formula, and Chemical Abstracts (CA) Registry Number. The formula is given either in terms of the IUPAC or Hill (25) system and the choice of formula is governed by what is usual for most current users: i.e., IUPAC for inorganic compounds, and Hill system for organic compounds. Components are ordered according to:

- (a) saturating components;
- (b) non-saturating components in alphanumeric order;
- (c) solvents in alphanumeric order.

The saturating components are arranged in order according to a 18-column periodic table with two additional rows:

Columns 1 and 2: H, alkali elements, ammonium, alkaline earth elements

3 to 12: transition elements

13 to 17: boron, carbon, nitrogen groups; chalcogenides, halogens

18: noble gases

Row 1: Ce to Lu

Row 2: Th to the end of the known elements, in order of atomic number.

Salt hydrates are generally not considered to be saturating components since most solubilities are expressed in terms of the anhydrous salt. The existence of hydrates or solvates is carefully noted in the text, and CA Registry Numbers are given where available, usually in the critical evaluation. Mineralogical names are also quoted, along with their CA Registry Numbers, again usually in the critical evaluation.

**Original Measurements.** References are abbreviated in the forms given by Chemical Abstracts Service Source Index (CASSI). Names originally in other than Roman alphabets are given as transliterated by Chemical Abstracts.

**Experimental Values.** Data are reported in the units used in the original publication, with the exception that modern names for units and quantities are used; e.g., mass per cent for weight per cent; mol dm<sup>-3</sup> for molar; etc. Both mass and molar values are given. Usually, only one type of value (e.g., mass per cent) is found in the original paper, and the compiler has added the other type of value (e.g., mole per cent) from computer calculations based on 1983 atomic weights (26).

Errors in calculations and fitting equations in original papers have been noted and corrected, by computer calculations where necessary.

**Method. Source and Purity of Materials.** Abbreviations used in Chemical Abstracts are often used here to save space.

**Estimated Error.** If these data were omitted by the original authors, and if relevant information is available, the compilers have attempted to estimate errors from the internal consistency of data and type of apparatus used. Methods used by the compilers for estimating and reporting errors are based on the papers by Ku and Eisenhart (27).

**Comments and/or Additional Data.** Many compilations include this section which provides short comments relevant to the general nature of the work or additional experimental and thermodynamic data which are judged by the compiler to be of value to the reader.

**References.** See the above description for Original Measurements.

#### Guide to the Evaluations

The evaluator's task is to check whether the compiled data are correct, to assess the reliability and quality of the data, to estimate errors where necessary, and to recommend "best" values. The evaluation takes the form of a summary in which all the data supplied by the compiler have been critically reviewed. A brief description of the evaluation sheets is given below.

**Components.** See the description for the Compilations.

**Evaluator.** Name and date up to which the literature was checked.

#### Critical Evaluation

(a) **Critical text.** The evaluator produces text evaluating all the published data for each given system. Thus, in this section the evaluator reviews the merits or shortcomings of the various data. Only published data are considered; even published data can be considered only if the experimental data permit an assessment of reliability.

(b) **Fitting equations.** If the use of a smoothing equation is justifiable the evaluator may provide an equation representing the solubility as a function of the variables reported on all the compilation sheets.

(c) **Graphical summary.** In addition to (b) above, graphical summaries are often given.

(d) **Recommended values.** Data are recommended if the results of at least two independent groups are available and they are in good agreement, and if the evaluator has no doubt as to the adequacy and reliability of the applied experimental and computational procedures. Data are considered as tentative if only one set of measurements is

available, or if the evaluator considers some aspect of the computational or experimental method as mildly undesirable but estimates that it should cause only minor errors. Data are considered as doubtful if the evaluator considers some aspect of the computational or experimental method as undesirable but still considers the data to have some value in those instances where the order of magnitude of the solubility is needed. Data determined by an inadequate method or under ill-defined conditions are rejected. However references to these data are included in the evaluation together with a comment by the evaluator as to the reason for their rejection.

(e) References. All pertinent references are given here. References to those data which, by virtue of their poor precision, have been rejected and not compiled are also listed in this section.

(f) Units. While the original data may be reported in the units used by the investigators, the final recommended values are reported in S.I. units (1, 28) when the data can be accurately converted.

**CRITICAL EVALUATION:****THE BINARY SYSTEM**

Data for the solubility of LiClO<sub>3</sub> in water have been reported in five publications (1-5). The data of Mylius and Funk (1) and Treadwell and Ammann (4) can immediately be rejected because of their inconsistencies (low solubilities indicating failure to approach equilibrium), and the fact that many experimental details are absent. Although Mylius and Funk (1) suggest that the anhydrous salt is the solid phase, the value for the solubility is much too low for the experimental temperature of 291 K. Treadwell and Ammann (4) do not report the nature of the solid phases.

The remaining studies (2,3,5) all report complete phase diagrams which qualitatively appear to be in good agreement, but detailed examination of the solubility data show significant differences. All authors agree that the binary system has a tendency to form metastable solutions which probably contributes to the causes in some important differences in solubility data.

Based on the analyses of the three major works (2,3,5), the evaluators agree with Campbell and Griffiths (5) that the various solid phases present in the binary system are:

ice	LiClO <sub>3</sub> .1/4H <sub>2</sub> O
LiClO <sub>3</sub> .3H <sub>2</sub> O [66295-75-8]	β-LiClO <sub>3</sub>
LiClO <sub>3</sub> .H <sub>2</sub> O	α-LiClO <sub>3</sub>

All three major studies agree, in general, on the temperature ranges over which six solid phases exist, but disagreement exists on the composition of several of these phases. Over the temperature range of 262-317 K, Berg (3) claims the solid phase to be LiClO<sub>3</sub>.1/3H<sub>2</sub>O, Kraus and Burgess (2) claim it to be an anhydrous γ-LiClO<sub>3</sub>, and Campbell and Griffiths (5) have shown it to be LiClO<sub>3</sub>.1/4H<sub>2</sub>O.

In their attempts to determine transition temperatures over the temperature range 262-317 K, Campbell and Griffiths experienced difficulty with metastability. Very careful dilatometric measurements over the range of 308-323 K (5) revealed no transition at 314.7 K which is the temperature claimed by Kraus and Burgess (2) for the γ-LiClO<sub>3</sub> β-LiClO<sub>3</sub> transition. X-ray diffraction patterns of anhydrous LiClO<sub>3</sub> prepared at room temperature and after heating to 353 K showed no change in the X-ray patterns (5). Campbell and Griffiths also found that Berg's photomicrographs of the so-called 1/3-hydrate were identical to the solid phase determined to be (see below) LiClO<sub>3</sub>.1/4H<sub>2</sub>O (5). The stoichiometry of the 1/4-hydrate was unambiguously proved in (5) by studying the ternary LiClO<sub>3</sub> - LiCl - H<sub>2</sub>O system. By application of the wet residue method of Schreinemakers, Campbell and Griffiths found that the tie lines (none of which ever crossed) were very reproducible and converged to a single composition of (LiClO<sub>3</sub>)<sub>4</sub>H<sub>2</sub>O. The evaluators therefore conclude that the stable solid phase over the temperature range of 293-315 K is the 1/4-hydrate, and that Berg's 1/3-hydrate and Kraus and Burgess' anhydrous γ-LiClO<sub>3</sub> are in fact the 1/4-hydrate.

To evaluate the solubility data from (2,3,5), we separately examined each polytherm in the phase diagram, and fitted the data to the smoothing equation (see eq. [1] in the PREFACE)

$$Y_x = A/(T/K) + B \ln(T/K) + C + D(T/K) \quad [1]$$

where

$$Y_x = \ln \left\{ \chi^{v(1-x)r(v+r)^{v+r}} / [x^r(1+x)^{v+r}] \right\} \quad [2]$$

<p>COMPONENTS:</p> <p>(1) Lithium chloride; LiClO<sub>3</sub>; [13543-71-9]</p> <p>(2) Water; H<sub>2</sub>O; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto  Department of Chemistry  Niigata University  Niigata, Japan  and  M. Salomon  US Army ET &amp; DL  Fort Monmouth, NJ, USA</p> <p style="text-align: right;">August, 1984</p>
<p>CRITICAL EVALUATION:</p> <p>In eq. [2], <math>r</math> is the hydration number in the solid phase, <math>v</math> is the number of ions produced upon dissolution (<math>v = 2</math> for LiClO<sub>3</sub>), and <math>\chi</math> is the mole fraction solubility (note that for the ice polytherm, <math>v = 0</math> and <math>r = 1</math>). In general, when applying the solubility data from (2,3,5) to eqs. [1] and [2], a number of solubilities were rejected when the difference in calculated and observed solubilities (<math>\chi_{\text{calcd}} - \chi_{\text{obsd}}</math>) exceeded <math>2\sigma_x</math>. <math>\sigma_x</math> is the standard error of estimate defined in the usual manner by:</p> $\sigma_x = [\sum(\chi_{\text{obsd}} - \chi_{\text{calcd}})^2 / (N - NC)]^{1/2} \quad [3]$ <p>where <math>N</math> is the number of data points, and <math>NC</math> is the number of constants adjusted in eq. [1]. For all the polytherms in the binary LiClO<sub>3</sub> - H<sub>2</sub>O system, a four constant fit was used: i.e. <math>NC = 4</math>. The results of fitting the data to eq. [1] are given in Table 1, and additional details are given below. The results of these analyses were used to construct detailed graphs of portions of the polytherms in the regions of phase transitions. From these graphs the evaluators were able to determine the nine observable transition temperatures by graphical interpolation, and the results are given in Table 2. Details on the evaluation of the solubility data for each polytherm follow.</p> <p><u>Polytherm For Ice As The Solid Phase</u></p> <p>All 16 data points reported in (2) and (5) were used to adjust the constants in the smoothing equation (see Table 1). Mole fraction solubilities at rounded temperatures based on this analysis are designated as <i>recommended</i> values, and are listed in Table 3. Based on our graphical interpolation, we find the recommended temperature and solubility at the ice <math>\rightarrow</math> LiClO<sub>3</sub>.3H<sub>2</sub>O transition to be 230.55 K and 0.107, respectively. Both Kraus and Burgess (2) and Berg (3) reported this temperature as 233.2 K, and Campbell and Griffiths (5) reported it as 229.85 K.</p> <p><u>Polytherm For LiClO<sub>3</sub>.3H<sub>2</sub>O As The Solid Phase</u></p> <p>Since the polytherm reaches a maximum at the congruent melting point (cmp), we analyzed this system in two parts for <math>\chi &lt; 0.25</math> and for <math>\chi &gt; 0.25</math>.</p> <p>(a) <math>\chi &lt; 0.25</math>. Twenty data points from (2) and (5) were fitted to eq. [1]. Only one data point at 281.3 K (8.1°C) from (5) was omitted. The least squares fit to eq. [1] predicts a congruent melting point of 281.16 K.</p> <p>(b) <math>\chi &gt; 0.25</math>. All data points from (2) and (5) were considered, and all four points below 264.2 K were rejected. The resulting fit of 19 data points is given in Table 1, and the congruent melting point as calculated from eq. [1] is 281.12 K.</p> <p>The solubility at the average cmp of 281.14 K is thus 0.25 mole fraction or 18.503 mol kg<sup>-1</sup>. Berg (3) reported a cmp of 281.3 K, Kraus and Burgess (2) 281.2 K, and Campbell and Griffiths (5) reported 281.3 K (melting point) and 281.6 K (graphical).</p> <p>Two metastable transitions involving the trihydrate were found in all three major studies. For the LiClO<sub>3</sub>.3H<sub>2</sub>O <math>\rightarrow</math> LiClO<sub>3</sub>.1/4 transition (eutectic), the evaluators graphically determined the temperature to be 261.15 K compared to 264 K in (3) and 262.7 K in (5).</p> <p>For the metastable LiClO<sub>3</sub>.3H<sub>2</sub>O <math>\rightarrow</math> <math>\beta</math>-LiClO<sub>3</sub> eutectic transition, a temperature of 248.5 K was found by the evaluators which is the same value reported in all three major studies (2,3,5).</p> <p>All calculated solubilities based on the smoothing equation are designated as <i>recommended</i>, and values at rounded temperatures are given in Table 3.</p>	

<p>COMPONENTS:</p> <p>(1) Lithium chlorate; <math>\text{LiClO}_3</math>; [13543-71-9]</p> <p>(2) Water; <math>\text{H}_2\text{O}</math>; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto          Department of Chemistry          Niigata University          Niigata, Japan          and          M. Salomon          US Army ET &amp; DL          Fort Monmouth, NJ, USA</p> <p style="text-align: right;">August, 1984</p>
<p>CRITICAL EVALUATION:</p> <p><u>Polytherm For <math>\text{LiClO}_3 \cdot \text{H}_2\text{O}</math> As The Solid Phase.</u></p> <p>While there is qualitative agreement between the results in (2,3,5), quantitative agreement does not exist and we are forced to select a preferred set of data. Since Berg's data, particularly at the lower temperatures, are radically different from those in (2,5) we can safely reject these results. We cannot offer convincing evidence favoring either set of data from (2) or (5), and at this time we prefer to use Campbell and Griffiths' results. The smoothed data based on (5) are given in Table 4, and are designated as <i>tentative</i> solubilities.</p> <p>The evaluators have calculated a congruent melting point of 310.5 K at <math>x = 0.500</math> (<math>m = 55.508 \text{ mol kg}^{-1}</math>), but it should be noted that a melting point for <math>\text{LiClO}_3 \cdot \text{H}_2\text{O}</math> has not been measured and that it may not melt congruently.</p> <p>By graphical interpolation the evaluators find the <math>\text{LiClO}_3 \cdot \text{H}_2\text{O} \rightarrow \text{LiClO}_3 \cdot 1/4\text{H}_2\text{O}</math> transition temperature to be 292.85 K. This transition temperature was reported as 294.2 K, 295.2 K, and 293.65 K in (2,3,5), respectively.</p> <p><u>Polytherm For <math>\text{LiClO}_3 \cdot 1/4\text{H}_2\text{O}</math> As The Solid Phase</u></p> <p>The confusion of the composition of this hydrate was discussed above. Summarizing, the evaluators agree with Campbell and Griffiths who accurately and unambiguously determined the composition as the 1/4-hydrate, and that both the <math>\gamma</math>-<math>\text{LiClO}_3</math> phase of Kraus and Burgess and the 1/3-hydrate of Berg are in fact the same phase deduced by Campbell and Griffiths as the 1/4-hydrate.</p> <p>The 1/4-hydrate easily forms metastable solutions as indicated above and from the fact that its solubility can be experimentally determined down to 261 K. In fitting the solubility data to eq. [1], again Berg's results had to be rejected, and two data points at 305.2 K and 300.8 K (32°C and 27.6°C) from Kraus and Burgess also had to be rejected. The results of fitting the remaining 24 data points to eq. [1] are given in Table 1, and smoothed solubilities designated as <i>tentative</i> values are given in Table 4. The smoothed values could not be designated as recommended because the agreement in experimental data from (2) and (5) is not particularly satisfactory as indicated by the large standard errors of estimate (<math>\sigma</math> values) in Table 1.</p> <p>By graphical interpolation the evaluators found the 1/4-hydrate <math>\rightarrow \beta</math>-<math>\text{LiClO}_3</math> transition at 314.85 K. For this transition Berg reported a temperature of 317 K, Kraus and Burgess reported this (eutectic) temperature as 314.7 K, and according to Campbell and Griffiths, this is a peritectic transition occurring at 315.15 K.</p> <p><u>Polytherms For Anhydrous <math>\text{LiClO}_3</math></u></p> <p>The three major studies (2,3,5) all agree that two anhydrous phases (<math>\beta</math> &amp; <math>\alpha</math>) exist, the latter constituting the higher temperature phase.</p> <p><u><math>\beta</math>-<math>\text{LiClO}_3</math>.</u> Forty-three data points reported in (2,3,5) were fitted to eq. [1] and the results are given in Table 1. The <math>\beta</math>-phase is stable over the range of 314.9-368.5 K (evaluators, see Table 2), but metastable solutions easily form at temperatures as low as 248 K. Because of the large standard errors of estimate obtained for this fit (see Table 1), the solubilities at rounded temperatures given in Table 4 are designated as <i>tentative</i> values.</p> <p><u><math>\alpha</math>-<math>\text{LiClO}_3</math>.</u> Of the 25 data points reported in (2,3), two points from (2) at 102.5°C and 126.7°C had to be rejected. The only data point above 372.1 K reported in (5) was the melting point of 400.6-400.7 K for <math>\alpha</math>-<math>\text{LiClO}_3</math>, and the value of 400.7 K was used in the least squares fit to eq. [1]. Based on this analysis (Table 1), solubilities at rounded temperatures were calculated and tabulated in Table 4: these solubilities are designated as <i>recommended</i> values.</p>	

<b>COMPONENTS:</b> (1) Lithium chlorate; $\text{LiClO}_3$ ; [13543-71-9] (2) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>EVALUATOR:</b> Hiroshi Miyamoto Department of Chemistry Niigata University Niigata, Japan Mark Salomon US Army ET & DL Fort Monmouth, NJ, USA August, 1984
<b>CRITICAL EVALUATION:</b> <p>The temperature of the <math>\beta \rightarrow \alpha</math> transition has proved somewhat difficult to determine. Direct thermal analyses showed marked hysteresis with transition temperatures ranging from 383 K (rising temp) to 353 K (falling temp), and a best value of 373.0 K was indicated from the falling temperature side (5). Both Berg (3) and Kraus and Burgess (2) report a value of 382 K for this transition. By graphical interpolation the evaluators determined this transition temperature as 368.45 K at a solubility of <math>\chi = 0.778</math>. The least squares fit of the data to eq. [1] predicts a melting point of 400.72 K.</p> <p>The complete phase diagram for the binary system given by Campbell and Griffiths is reproduced below following the data tables.</p> <p style="text-align: center;"><b>TERNARY SYSTEMS</b></p> <p>The only system reported is that by Campbell and Griffiths (5) for the system <math>\text{LiClO}_3 - \text{LiCl} - \text{H}_2\text{O}</math>, and for temperatures of 276.0 K, 279.0 K, 281.7 K, and 298.2 K. Some discussion was presented above with emphasis on the confirmation of the 1/4-hydrate solid phase by Schreinemakers' method of wet residues. The four isotherms reported in (5) are reproduced below following the data tables for the binary <math>\text{LiClO}_3 - \text{H}_2\text{O}</math> system.</p> <p style="text-align: center;"><b>REFERENCES</b></p> <ol style="list-style-type: none"><li>1. <b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubilities were determined by thermal analysis (cooling curves). A weighed quantity of salt (12-28 g) was placed in a tube which was sealed with a rubber stopper. The stopper was fitted with a mercury sealed stirrer, a nitrogen inlet, an inlet to permit additions of water from a pycnometer with a long delivery tube, and a copper-constantan thermocouple. The solubility tube was fitted with an air jacket, and the apparatus placed in an oil or water thermostat. Nitrogen was passed through the upper part of the tube during additions of water, and experiments were carried with a slight excess pressure of $\text{N}_2$ . After the determination of the melting point of the anhydrous salt, successive known quantities of water were added, and the solution cooled to obtain precipitation. Four independent series of experiments were carried out.			<b>SOURCE AND PURITY OF MATERIALS:</b> Lithium chlorate solutions were prepd by slowly adding a 5.5 N solution of barium chlorate to a 4.5 N solution of lithium sulfate, both solutions being near the boiling point. The pptd $\text{BaSO}_4$ was removed by filtration, and the filtrate treated with barium chlorate and sulfate to insure equivalence of $\text{LiClO}_3$ . $\text{LiClO}_3$ was pptd from the filtrate in several steps by slowly evaporating the solvent in vacuum over $\text{P}_2\text{O}_5$ . Care was taken to prevent the salt in the highly concentrated solution (around 90 % of salt) from decomposing by keeping the temp below 50°C. The resulting salt was pulverized and finally dried in a desiccator over $\text{P}_2\text{O}_5$ under high vacuum. Lithium sulfate prepd from the recrystd carbonate with sulfuric acid. The ppt was washed and dried at 130°C. Barium chlorate of the highest obtainable purity was recrystd from water several times and was dried at 130°C.		
			<b>ESTIMATED ERROR:</b> Nothing specified.

AUXILIARY INFORMATION					
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:		
<p>Two different methods were used to determine the solubility of lithium chlorate in water. (1) Synthetic method used with visual observation of temperature of crystallization. The weighed salt and water were placed into a test-tube equipped with a stirrer and a thermocouple. The test-tube was placed in a larger test-tube which was then placed in a paraffin oil bath. The bath was slowly and evenly warmed. When the salt in the tube disappeared, the temperature of the sample solution was measured by the thermocouple. Next the bath was gently cooled, and when the salt appeared the temperature was measured again. (2) The isothermal method was used to obtain an accurate liquidus curve. The salt and water were placed into an apparatus with stirrer fitted with a mercury seal. The apparatus was placed in an oil thermostat. The lithium content was determined gravimetrically (in duplicate) as lithium sulfate.</p>			No information was given.

<b>AUXILIARY INFORMATION</b>				
<p>For solutions in equilibrium with ice, the solubilities were determined by the thermal method. The compositions of saturated solutions were determined by chemical analysis. The method of thermal analysis was also used for binary eutectics and <math>\alpha \rightarrow \beta</math> transition, and all other solubilities were determined "in the usual way" (i.e. the isothermal method, compiler). Temperatures for thermal analyses were measured with an iron-constantan thermocouple and a potentiometer. The composition of the solid solutions was determined by chlorate analysis. Aliquots were transferred to a 250 ml iodine flask and 40 ml concentrated orthophosphoric acid added, followed by the addition of about 0.1 g sodium carbonate to exclude air from the flask. Approximately 25 ml of iodate-free potassium iodide solution (0.2 gm/ml) was added, and the stoppered flask allowed to stand at room temperature for 60 to 70 min. The free iodine was titrated with sodium thiosulphate. Standardization of the method with pure sodium chlorate indicated an accuracy of <math>\pm 0.4\%</math>.</p>

## AUXILIARY INFORMATION

## SOURCE AND PURITY OF MATERIALS:

A 1 mol dm<sup>-3</sup> barium chlorate solution was heated to about 85°C, and a 1 mol dm<sup>-3</sup> lithium sulfate solution was added slowly from a dropping funnel until equivalence was reached. The precipitated barium sulfate was removed by repeated filtration. The solution was evaporated slowly up to an approximated concentration of 50 % lithium chlorate. The filtered solution was transferred to a 250 ml Claissen flask and dehydration was carried out under a reduced pressure of less than 5 mm Hg, the distillate being absorbed in concentrated sulfuric acid. In this process, the temperature was kept below 85°C. Upon cooling, the solution to room temperature, the salt crystallized; it was placed under vacuum over phosphorus pentoxide. To remove the last trace of water, the salt was placed in a vacuum oven over phosphorus pentoxide, and maintained at 80°C.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> <p>The isothermal method was used. Equilibrium was approached from two directions. A given solution was divided into equal parts, and one part was heated to complete dissolution of the solid, and the second part was completely frozen. Both portions were then thermostated until the compositions of the liquid phases were identical. For solutions up to 10 % LiCl, equilibrium was attained after 2-3 days of stirring. For higher LiCl concentrations, 5-6 days of stirring were required to attain equilibrium.</p> <p>To determine LiClO<sub>3</sub> compositions, aliquots were transferred to 250 ml iodine flasks to which 40 ml concentrated orthophosphoric acid were added followed by the addition of about 0.1 g sodium carbonate to exclude air from the flask. Approximately 25 ml of iodate-free potassium iodide solution (0.2 gm/ml) was added, and the stoppered flask allowed to stand at room temperature for 60 to 70 min. The free iodine was titrated with sodium thiosulphate. Standardization of the method with pure sodium chlorate indicated an accuracy of ± 0.4 %.</p> <p>The chloride content of solutions containing appreciable amounts of chlorate was determined volumetrically with silver nitrate solution using an alcoholic solution of sodium dichlorofluoresceinate for the indicator. For solutions containing less than five percent chloride, the standard gravimetric method was used.</p> <p>Compositions of the solid phases were determined by Schreinemakers' method.</p>

<b>AUXILIARY INFORMATION</b>																
<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions were prepared in an Erlenmeyer flask by mixing the dried acetone with an excess of halate for two hours. The solution was constantly stirred by bubbling dry air (air was dried by passing it through $\text{CaCl}_2$ while pumping it into the solution). Air going out from the flask after bubbling through the solution carried some acetone vapor during this operation. The solution temperature was kept constant by immersing the flask in a constant temperature water bath. After two hours, the air exit was closed. The resulting pressure forced the saturated solution from the Erlenmeyer through a tube filled with cotton (which acted as a filter), and was collected in a small flask. This flask was stoppered and weighed. The halate contained in the sample was weighed after complete evaporation of acetone. In all cases, weights were reported to the fourth decimal figure.	<b>SOURCE AND PURITY OF MATERIALS:</b> Commercial redistilled acetone. This acetone was then dehydrated three times by leaving it in contact with calcium chloride for forty eight hours each time. Fresh $\text{CaCl}_2$ was used in each operation. Finally the dehydrated acetone was distilled at 56.3°C. Source and purity of $\text{LiClO}_3$ not specified.															
<b>ESTIMATED ERROR:</b> Nothing specified.

<p>CRITICAL EVALUATION:</p> <p style="text-align: center;">THE BINARY SYSTEM</p> <p>Data for the solubility of sodium chlorate in water have been reported in 22 publications (1-21,30). Many of these studies deal with ternary systems, and the solubility in the binary NaClO-H<sub>2</sub>O system is given as one point on a phase diagram. Many investigators (4, 6-8, 10-20) reported that the stable solid in equilibrium with the saturated solutions over the temperature range between 273 K and 373 K was anhydrous sodium chlorate. Nabiev, Tukhtaev, Musaev, Kuchrov and Shimmasov (21) measured the solubility for the binary NaClO<sub>3</sub>-H<sub>2</sub>O system at 254.7 K, and the stable phases were NaClO<sub>3</sub> and ice.</p> <p>Blanc and Schmandt (1), Bell (3) and Treadwell and Ammann (9) reported solubilities in the binary NaClO<sub>3</sub>-H<sub>2</sub>O system only. Bittler (2), Bell (3) and Nies and Hulbert (18) reported solubilities over a wide temperature range.</p> <p>A summary of solubility studies for the binary NaClO<sub>3</sub>-H<sub>2</sub>O system is given in Table 1.</p> <p>1. Evaluation for the solubility based on mol kg<sup>-1</sup> units.</p> <p><u>Solubility at 273.2 K.</u> The solubility has been reported in 3 publications (3, 7, 18). The value by Babaeva (7) is very distinctly larger than that of two other investigators. The arithmetic mean of two results (7, 18) is 7.465 mol kg<sup>-1</sup>. The mean is designated as a tentative value.</p> <p><u>Solubility at 283.2 K.</u> The solubility has been reported in 2 publications (3, 18). The value recommended for the solubility at this temperature is taken as 8.220 mol kg<sup>-1</sup>, which is the arithmetic mean of the two results.</p> <p><u>Solubility at 293.2K.</u> The solubility has been reported in 6 publications (3, 5-7, 9, 18) at 293.2 K, and in one article (1) at 293.0 K. The value of 8.994 mol kg<sup>-1</sup> by Blanc and Schmandt (1) is larger than that of Nies and Hulbert (18). The reported solubilities at this temperature are widely distributed from 8.976 to 9.282 mol kg<sup>-1</sup>. The tentative value was obtained as the arithmetic mean of 7 results (1, 3, 5-7, 9, 18). The value is 9.14 mol kg<sup>-1</sup>, and the standard deviation is 0.14 mol kg<sup>-1</sup>.</p> <p><u>Solubility at 298.2 K.</u> The solubility at this temperature has been reported in 10 publications (3, 8, 10-13, 17, 19, 20, 30). The value of Vlasov and Shishkina (2) is distinctly lower than that of the other investigators, and the study of Arkhipo, Kashina and Kuzina (17) reported the highest value. Therefore, these two values are rejected. The arithmetic mean of the remaining 7 results (3, 8, 10-13, 19, 30) is 9.43 mol kg<sup>-1</sup>, and the standard deviation is 0.02 mol kg<sup>-1</sup>. The mean is designated as a recommended value.</p> <p><u>Solubility at 303.2 K.</u> The value has been reported in 3 publications (1, 3, 18). The arithmetic mean of 3 results is 9.86 mol kg<sup>-1</sup>, and the standard deviation is 0.04 mol kg<sup>-1</sup>. The mean is designated as a recommended value.</p> <p><u>Solubility at 308.2 K.</u> The solubility has been reported in one publication (3) at 308.2 K and in one publication (1) at 308.3 K. Both values are identical. The estimated error in temperature measurement is ± 0.02 K by Bell (1) and nothing specified by Blanc and Schmandt (1). The tentative value at 308.2 K is taken as 10.33 mol kg<sup>-1</sup>.</p> <p><u>Solubility at 313.2 K.</u> The solubility has been reported in 4 publications (3, 4, 7, 18). The value of Babaeva (18) was markedly higher than those of the other researchers (3, 4, 7) and is therefore rejected. The arithmetic mean of the remaining 3 results (3, 4, 7) is 10.86 mol kg<sup>-1</sup>, and the standard deviation is 0.07 mol kg<sup>-1</sup>. The mean is designated as a recommended value.</p> <p><u>Solubility at 318.2 K.</u> The recommended value for the solubility at this temperature is taken as 11.27 mol kg<sup>-1</sup> which is the arithmetic mean of two results (8, 18).</p>

## CRITICAL EVALUATION:

Solubility at 323.2K. The solubility has been reported in 3 publications (10, 11, 18). The arithmetic mean of 3 results is 11.74 mol kg<sup>-1</sup>, and the standard deviation is 0.03 mol kg<sup>-1</sup>. The mean is designated as a recommended value.

Solubility at 348.2 K. The recommended value for the solubility at this temperature is taken as 14.87 mol kg<sup>-1</sup> which is the arithmetic mean of two results (8, 18).

Solubility at other temperatures. The solubilities at 277.9 K (1), 288.2 K (8), 292.2 K (11), 297.4 K (4), 317.9 K (1), 333.2 K (18), 371.2 K (18) and 373.2 K (3) are singular values, and are designated as tentative solubilities. A summary of all solubility data in the binary for which anhydrous NaClO<sub>3</sub> is the sole solid phase is given in Table 1.

The recommended and tentative solubilities for the binary NaClO<sub>3</sub>-H<sub>2</sub>O system for which the solid phase is the anhydrous salt is given in Table 2. The experimental mol kg<sup>-1</sup> solubilities were fitted to the following smoothing equation:

$$\ln (m_1/\text{mol kg}^{-1}) = 34.97670 - 48.488690/(T/100 \text{ K}) - 31.26105 \ln (T/100 \text{ K}) \\ + 5.929873 (T/100 \text{ K}) \quad \sigma = 0.08$$

The mole fraction solubilities calculated by the evaluator was fitted to the general solubility equation (see the PREFACE and eqs. [1] and [2] in the critical evaluation for the binary LiClO<sub>3</sub>-H<sub>2</sub>O system):

$$Y = -4838.039/(T/K) - 27.7668 \ln(T/K) + 156.124 + 0.0521925(T/K) \\ \sigma_y = 0.0108 \quad \sigma_x = 0.00099$$

The tentative solubilities in the binary system based on mol dm<sup>-3</sup> based on the results of Billiter (2) were fitted by the evaluator to the following equation:

$$\ln (c_1/\text{mol dm}^{-3}) = 2.456277 - 3.660476/(T/100 \text{ K}) + 0.6567005 \ln (T/100 \text{ K}) \\ \sigma = 0.03$$

## COMPONENTS:

## TERNARY SYSTEMS

Many studies for the solubility of the aqueous ternary system with two saturating components have been reported. A summary of the studies is given in Tables 3-6.

Systems with alkali halides. Solubility studies of the ternary systems containing sodium chlorate and alkali halides have been reported in 11 publications (2, 5, 12, 16, 17, 20, 22, 24, 28). A summary of these studies with that of the ternary  $\text{NaClO}_3$ - $\text{BaCl}_2$ - $\text{H}_2\text{O}$  system is given in Table 3.

Table 3. Summary of Solubility Studies in Ternary Systems with Alkali Metal and Barium Halides.

Ternary System	T/K	Solid phase	Reference
$\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$	293, 303, 333, 353, 373	Not given	2
$\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$	293	Not given	5
$\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$	298, 308, 318	$\text{NaClO}_3$ ; $\text{NaCl}$	16
$\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$	298	$\text{NaClO}_3$ ; $\text{NaCl}$	17
$\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$	293	Not given	22
$\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$	247 - 373	$\text{NaClO}_3$ ; $\text{NaCl} \cdot 2\text{H}_2\text{O}$ $\text{NaCl}$ ; Ice	24
$\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$	298	Not given	28
$\text{NaClO}_3$ - $\text{NaBr}$ - $\text{H}_2\text{O}$	298	$\text{NaClO}_3$ ; $\text{NaBr} \cdot 2\text{H}_2\text{O}$	12
$\text{NaClO}_3$ - $\text{NaI}$ - $\text{H}_2\text{O}$	298	$\text{NaClO}_3$ ; $\text{NaI} \cdot 2\text{H}_2\text{O}$	12
$\text{NaClO}_3$ - $\text{NaF}$ - $\text{H}_2\text{O}$	298	$\text{NaClO}_3$ ; $\text{NaF}$	20
$\text{NaClO}_3$ - $\text{KCl}$ - $\text{H}_2\text{O}$	298	Not given	5
$\text{NaClO}_3$ - $\text{BaCl}_2$ - $\text{H}_2\text{O}$	293	Not given	6

Solubilities in the ternary  $\text{NaClO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$  system have been reported in 7 publications (5, 7, 16, 17, 22, 24, 28). Di Capua and Scaletti (5) and Arkhipov, Kashina and Kuzina (17) measured solubilities (mass % units) of the two saturating components ( $\text{NaClO}_3$  and  $\text{NaCl}$ ) over a wide concentration range at 293 and 298 K, respectively. No double salts are formed in this system.

Nallet and Paris (24) reported only one value (mass % units) at each temperature between 246 and 373 K. The details of solid phases are described on the compilation sheets. No double salts formed.

Solubilities in the aqueous ternary system based on  $\text{g cm}^{-3}$  units have been reported by Winteler (22), and by Billiter (2). Because of insufficient experimental information, it was not possible to compare these two studies.

The paper by Perel'man and Korzenyak (28) contained only a phase diagram, and was therefore not compiled.

The solubilities in ternary systems  $\text{NaClO}_3$ - $\text{NaBr}$ - $\text{H}_2\text{O}$  and  $\text{NaClO}_3$ - $\text{NaI}$ - $\text{H}_2\text{O}$  at 298 K were studied by Ricci (2) and the system  $\text{NaClO}_3$ - $\text{NaF}$ - $\text{H}_2\text{O}$  at 298 K was studied by Vlasov and Shishkina (20). These salt pairs formed neither double salts nor solid solutions at this temperature. The ternary  $\text{NaClO}_3$ - $\text{NaF}$ - $\text{H}_2\text{O}$  system was of simple eutonic type.

## COMPONENTS:

- (1) Sodium chlorate;  $\text{NaClO}_3$ ; [7757-82-6]  
 (2) Water;  $\text{H}_2\text{O}$ ; [7732-18-5]

## EVALUATOR:

June, 1984

## CRITICAL EVALUATION:

Only one result in the  $\text{NaClO}_3$ - $\text{KCl}$ - $\text{H}_2\text{O}$  system was reported by Di Capua and Scaletti (5), and solubilities in the  $\text{NaClO}_3$ - $\text{BaCl}_2$ - $\text{H}_2\text{O}$  were reported by Di Capua and Bertoni (6). The solid phases in both papers were not reported.

Systems with other halates. Solubility studies of ternary systems containing sodium chlorate and other halates have been reported in 8 publications (4-6, 10, 17, 19, 23, 24). A summary of these studies with that of the ternary system  $\text{NaClO}_3$ - $\text{NaClO}_2$ - $\text{H}_2\text{O}$  is given in Table 4.

Table 4. Summary of Solubility Studies in Ternary Systems with other Halates

Ternary System	T/K	Solid Phase	Reference
$\text{NaClO}_3$ - $\text{KClO}_3$ - $\text{H}_2\text{O}$	297, 313	$\text{NaClO}_3$ ; $\text{KClO}_3$	4
$\text{NaClO}_3$ - $\text{KClO}_3$ - $\text{H}_2\text{O}$	293	Not given	5

Solubilities in the  $\text{NaClO}_3$ - $\text{KClO}_3$ - $\text{H}_2\text{O}$  system were studied by Il'inskii (4) at 297.4 and 313 K, and by Di Capua and Scaletti (5) at 293 K. No double salts were formed. The results for the composition at the isothermally invariant point were reported by Munter and Brown (23).

Nallet and Paris (24) reported only one solubility at each temperature between 255.3 K and 373 K. The details of solid phases are described in the compilation. No double salts were formed.

Solubilities in the ternary  $\text{NaClO}_3$ - $\text{RbClO}_3$ - $\text{H}_2\text{O}$  and  $\text{NaClO}_3$ - $\text{CsClO}_3$ - $\text{H}_2\text{O}$  systems have been reported by Arkhipov, Kashina and Kuzina (17), and Arkhipov and Kashina (19), respectively. Solubilities in the ternary  $\text{NaClO}_3$ - $\text{Ba}(\text{ClO}_3)_2$ - $\text{H}_2\text{O}$  system have been reported by Di Capua and Bertoni (6). All systems were simple eutonic, and no double salts were formed.

Solubilities in the ternary  $\text{NaClO}_3$ - $\text{NaBrO}_3$ - $\text{H}_2\text{O}$  system were measured by Swenson and Ricci (10). The salts studied at 298 K formed a series of solid solutions which is apparently discontinuous. The solubility curve at 298 K appears to be divided into three portions corresponding to the following solid phases: (1) pure sodium bromate, (2) a sodium bromate solid solution containing up to about 5-10 mass % sodium chlorate, (3) a sodium chlorate solid solution containing from 0 to 60-65 mass % sodium bromate.

Cunningham and Oey (15) have reported solubilities in the ternary system  $\text{NaClO}_3$ - $\text{NaClO}_2$ - $\text{H}_2\text{O}$ . The system is simple and the solid phases were sodium chlorate and sodium chlorite trihydrate. No hydrate of sodium chlorate was formed.

<b>COMPONENTS:</b> (1) Sodium chlorate; NaClO <sub>3</sub> ; [7757-82-6] (2) Water; H <sub>2</sub> O; [7732-18-5]	<b>EVALUATOR:</b> Hiroshi Miyamoto Department of Chemistry Niigata University Niigata, Japan
June, 1984	

**CRITICAL EVALUATION:**

The system with sodium sulfate. Solubilities in the ternary NaClO<sub>3</sub>-Na<sub>2</sub>SO<sub>4</sub>-H<sub>2</sub>O system have been reported in 3 publications (7, 8, 14). A summary of the studies is given in Table 5.

Table 5. A Summary of Solubility Studies in the Ternary System NaClO<sub>3</sub>-Na<sub>2</sub>SO<sub>4</sub>-H<sub>2</sub>O

T/K	Solid Phase	Reference
273	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub> .10H <sub>2</sub> O	7
288	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub> .10H <sub>2</sub> O	8
291	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub> .10H <sub>2</sub> O; Na <sub>2</sub> SO <sub>4</sub>	14
293	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub> .10H <sub>2</sub> O	7
298	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub> .10H <sub>2</sub> O; Na <sub>2</sub> SO <sub>4</sub>	8
	NaClO <sub>3</sub> .3Na <sub>2</sub> SO <sub>4</sub> (double salt)	
313	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub>	7
318	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub> ; NaClO <sub>3</sub> .3Na <sub>2</sub> SO <sub>4</sub>	8
348	NaClO <sub>3</sub> ; Na <sub>2</sub> SO <sub>4</sub> ; NaClO <sub>3</sub> .3Na <sub>2</sub> SO <sub>4</sub>	8

Solubilities in this system were determined over a wide temperature range. Ricci and Yanick (8) reported the existence of stable double salt with the formula NaClO<sub>3</sub>.3Na<sub>2</sub>SO<sub>4</sub>. The double salt was formed at 298 K and above, having always a very short range of stable existence, and persisting in metastable equilibrium over a very considerable range of concentrations. Although Babaeva (7) measured solubilities in this system at 313 K, the existence of the double salt was not found. Below 298 K no double salts were formed. The solid phases in the binary systems NaClO<sub>3</sub>-H<sub>2</sub>O and Na<sub>2</sub>SO<sub>4</sub>-H<sub>2</sub>O were NaClO<sub>3</sub> and Na<sub>2</sub>SO<sub>4</sub>.10H<sub>2</sub>O at 298 K and below, respectively, and NaClO<sub>3</sub> and Na<sub>2</sub>SO<sub>4</sub> at 313 K and above, respectively. The composition of the solid phase between 298 and 313 K was not studied.

Systems with the other compounds. A summary of solubility studies in the system containing the other compounds except the salts discussed above is given in Table 6.

Table 6. Summary of Solubility Studies in Miscellaneous Ternary Systems

Ternary System	T/K	Solid Phase	Reference

---	--

**CRITICAL EVALUATION:**

Solubilities in the NaClO<sub>3</sub>-Na<sub>2</sub>CO<sub>3</sub>-H<sub>2</sub>O system by Il'inskii (4), in the NaClO<sub>3</sub>-Na<sub>2</sub>CrO<sub>4</sub>-H<sub>2</sub>O system by Ricci and Weltmann (11), in the NaClO<sub>3</sub>-NaNO<sub>3</sub>-H<sub>2</sub>O system by Ricci (12) and in the NaClO<sub>3</sub>-Na<sub>2</sub>MoO<sub>4</sub>-H<sub>2</sub>O system by Ricci and Linke (13) have been reported. Neither compound formation nor solid solution between any two salts were reported. Solubilities in the ternary NaClO<sub>3</sub>-NaOH-H<sub>2</sub>O system were reported by Windmaisser and Stockl (14), and no double salts were formed. Solubility isotherms at temperature between 353.9 and 348 K were determined for the NaClO<sub>2</sub>-NaBO<sub>3</sub>-H<sub>2</sub>O system by Nies and Hulbert (18). The solid phases were NaBO<sub>2</sub>·4H<sub>2</sub>O, NaBO<sub>2</sub>·2H<sub>2</sub>O and NaClO<sub>3</sub>. No double salts formed.

**OTHER MULTICOMPONENT SYSTEMS**

A summary of solubility studies in other multicomponent systems is given in Table 7.

Table 7. Summary of Solubility Studies in Multicomponent Systems

Multicomponent System	T/K	Reference
NaClO <sub>3</sub> - KClO <sub>3</sub> - NaCl - H <sub>2</sub> O	293	5
NaClO <sub>3</sub> - NaClO <sub>2</sub> - NaCl - H <sub>2</sub> O	283, 293, 303	26
NaClO <sub>3</sub> - NaClO <sub>2</sub> - NaCl - H <sub>2</sub> O	298, 303, 318	27
NaClO <sub>3</sub> - NaClO <sub>2</sub> - NaCl - H <sub>2</sub> O	298	28
NaClO <sub>3</sub> - NaCl - RbClO <sub>3</sub> - RbCl - H <sub>2</sub> O	298	17
NaClO <sub>3</sub> - NaCl - CsClO <sub>3</sub> - CsCl - H <sub>2</sub> O	298	19
NaClO <sub>3</sub> - NaCl - KClO <sub>3</sub> - KCl - H <sub>2</sub> O	273, 313	23
NaClO <sub>3</sub> - NaCl - KClO <sub>3</sub> - KCl - H <sub>2</sub> O	247 - 373	25
NaClO <sub>3</sub> - NaClO <sub>2</sub> - NaCl - Na <sub>2</sub> CO <sub>3</sub> - H <sub>2</sub> O	298	29

Only one solubility value in the NaClO<sub>3</sub>-KClO<sub>3</sub>-NaCl-KCl-H<sub>2</sub>O system at 293 K was reported by Di Capua and Scoletti (5). No other information was given.

Solubilities in the NaClO<sub>3</sub>-NaClO<sub>2</sub>-NaCl-H<sub>2</sub>O system were measured by Nakamori, Nagino, Hideshima and Hiraï (26) at 283, 293 and 303 K, and by Oey and Cunningham (27) at 298, 303 and 318 K. No double salts formed within the temperature interval 283-318 K.

Perel'man and Korgenyak (28) reported only a phase diagram, and the paper was therefore not compiled.

The NaClO<sub>3</sub>-NaCl-RbClO<sub>3</sub>-RbCl-H<sub>2</sub>O system was studied by Arkhipov, Kashina and Kuzina (17). Solubilities in the quaternary systems NaClO<sub>3</sub>-NaCl-RbClO<sub>3</sub>-H<sub>2</sub>O and RbClO<sub>3</sub>-NaCl-RbCl-H<sub>2</sub>O, have been reported, but the solubility data in five component systems were not reported. There were four salt crystallization regions in the system: NaCl, RbCl, NaClO<sub>3</sub> and RbClO<sub>3</sub>. Two ternary points were obtained corresponding to solutions saturated with: (i) NaCl+NaClO<sub>3</sub>+RbClO<sub>3</sub>; (ii) NaCl+RbCl+RbClO<sub>3</sub>. The main part of the diagram is occupied by the crystallization field of rubidium chlorate (95%), followed in area by the sodium chloride field (3.5 %). The four salts did not form either double salts or solid solutions.

The NaClO<sub>3</sub>-NaCl-CsClO<sub>3</sub>-CsCl-H<sub>2</sub>O system was studied by Arkhipov and Kashina (19). Solubilities in the quaternary systems NaClO<sub>3</sub>-CsClO<sub>3</sub>-NaCl-H<sub>2</sub>O and CsClO<sub>3</sub>-CsCl-NaCl-H<sub>2</sub>O have been reported, but the solubility data for five component systems were not reported. The crystallization field of cesium chlorate occupies the greatest area on the diagram, and this is followed by the field of sodium chloride. The crystallization fields of sodium chlorate and of solid solutions of cesium and sodium chlorides are small.

## COMPONENTS:

- (1) Sodium chlorate; NaClO<sub>3</sub>; [7757-82-6]  
 (2) Water; H<sub>2</sub>O; [7732-18-5]

## EVALUATOR:

Hiroshi Miyamoto  
 Department of Chemistry  
 Niigata University

June, 1984

## CRITICAL EVALUATION:

Munter and Brown (23) measured solubilities in the NaClO<sub>3</sub>-NaCl-KClO<sub>3</sub>-KCl-H<sub>2</sub>O system at the isothermal invariant point. The solid phase at this point is simple: no double salts were formed.

Nallet and Paris (25) also measured solubilities in the NaClO<sub>3</sub>-NaCl-KClO<sub>3</sub>-KCl-H<sub>2</sub>O system over a wide temperature range, but only one value at each temperature was reported. No double salts or solid solutions were reported.

The NaClO<sub>3</sub>-NaClO<sub>2</sub>-Na<sub>2</sub>CO<sub>3</sub>-NaCl-H<sub>2</sub>O system was studied by Perel'man and Korzhenyak (29). The compositions of the eutectic points of the ternary and quaternary systems were determined.

<b>AUXILIARY INFORMATION</b>																																					
<b>METHOD/APPARATUS/PROCEDURE:</b> A solution of sodium chlorate, saturated at the boiling point, was stirred vigorously in an electrically controlled thermostat at the required temperature for about three hours. A weighed sample was evaporated in a conical flask by immersing this in a bath at 100°C and gently distilling benzene on to the surface of the liquid. In about fifteen minutes the salt was obtained in a thin crust over the bottom of the flask. A shallow layer of benzene was then poured into the flask, which was heated in an air oven at 120°C until its weight was constant. The necessary buoyancy corrections were made to the observed weighings.	<b>SOURCE AND PURITY OF MATERIALS:</b> Nothing specified.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. AUXILIARY INFORMATION						
<b>METHOD/APPARATUS/PROCEDURE:</b> Solutions of about 200g containing NaBO <sub>2</sub> and NaClO <sub>3</sub> were prepd in polypropylene bottles, brought to the operating temp, usually seeded with about 50 g of the solid phases desired, and agitated for several hours to several days in a water or brine bath. At least three samples from each mixture were analyzed, and the averages are shown in the table and the figure. In some experiments the solid phases were detd by X-ray diffraction. Na <sub>2</sub> O and B <sub>2</sub> O <sub>3</sub> were detd by titrn with 0.5 mol dm <sup>-3</sup> HCl using methyl red followed by addition of mannitol and titration to phenolphthalein with 0.5 mol dm <sup>-3</sup> NaOH which had been standardized against recrystd dry boric acid. NaBO <sub>3</sub> mass % calcd from the percent of B <sub>2</sub> O <sub>3</sub> . Chlorate was detd either by boiling with SO <sub>2</sub> followed by analysis of the resulting chloride by the Volhard method, or by addition of excess FeSO <sub>4</sub> with H <sub>2</sub> SO <sub>4</sub> , boiling, and back-titrating with Na <sub>2</sub> Cr <sub>2</sub> O <sub>7</sub> using barium diphenylamine sulfonate indicator. The FeSO <sub>4</sub> solution was standardized with K <sub>2</sub> Cr <sub>2</sub> O <sub>7</sub> in the presence of H <sub>3</sub> PO <sub>4</sub> .			<b>SOURCE AND PURITY OF MATERIALS:</b> Photographic grade sodium metaborate dihydrate and tetrahydrate (United States Borax & Chem. Corp.) were used. The results of typical analysis were given in the following: 0.007 and 0.002 % SO <sub>4</sub> , 0.05 and 0.04 % Cl, 0.003 and 0.002 % Ca, 1 and 1.5 ppm Fe, respectively, and 10 ppm Al. Reagent grade NaClO <sub>3</sub> (J.T. Baker Chem Co) was used, assay 100.0 %, analysis 0.01 % BrO <sub>3</sub> and 0.003 % or less Ca, Mg and NH <sub>4</sub> OH precipitate, Cl, N, SO <sub>4</sub> and Fe. Distilled water was used.			
			<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K.

<b>AUXILIARY INFORMATION</b>																																																																																																											
<b>METHOD/APPARATUS/PROCEDURE:</b> Complexes were stirred for at least two days at 25°C. Equilibrium was established in several instances by constancy of composition upon repeated analysis. The analysis of the saturated aqueous sln involved argentometric titration of the chloride with eosin as absorption indicator, determination of water in a separate sample by evaporation, and calculation of the sodium chlorate by difference. A few of the chloride determinations for the isothermally invariant points were verified by the Volhard method. The solubilities of the individual salts were determined both volumetrically and by evaporation, with very close agreement between the two methods.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade $\text{NaClO}_3$ and $\text{NaNO}_3$ were used without further purification.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.05 \text{ K}$ .  <b>REFERENCES:</b>

AUXILIARY INFORMATION					
<b>METHOD/APPARATUS/PROCEDURE:</b> The compiler assumes that the isothermal method was used. Equilibrium was reached in 2 to 3.5 hours. The sodium chlorate content was determined volumetrically by addition of iron (II) sulfate solution to the sample solution, and back-titrating the excess Fe(II) with potassium permanganate solution. The solution containing sodium chlorate and sodium sulfate was heated with sulfuric acid and then successively heated to dryness. The sodium sulfate content was calculated by difference. The composition of the solid phase was identified by microscopy and direct analysis.			<b>SOURCE AND PURITY OF MATERIALS:</b> "Chemically pure" grade sodium chlorate and sulfate were recrystallized.		
			<b>ESTIMATED ERROR:</b> Nothing specified.

<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b> Weighed complexes of known composition were equilibrated by stirring in a large water bath. The time required for attainment of equilibrium was determined by analysis, and required several weeks. The order of mixing of the components, and the process of seeding or inoculations for required phases had to be varied in accordance with the phase sought.  Chlorate was determined by the method of Peters and Deutshlander (1): to the chlorate sample (containing about 0.11g of $\text{ClO}_3^-$ ) was added a definite volume ( $50 \text{ cm}^3$ ) of $0.05 \text{ mol dm}^{-3}$ arsenious oxide solution; after the addition of a trace of KBr, the solution was acidified strongly with HCl and boiled for ten minutes. The excess arsenious oxide was then titrated by means of $0.033 \text{ mol dm}^{-3}$ $\text{KBrO}_3$ solution using indigo sulfonic acid as an indicator.			<b>SOURCE AND PURITY OF MATERIALS:</b> Nothing specified.			
			<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.02 \text{ K}$ .

## AUXILIARY INFORMATION

continued.....

## METHOD/APPARATUS/PROCEDURE:

The total solid was determined by evaporation to dryness at 100°C followed by heating to 250°C, and the sulfate was then calculated by difference.

For the identification of known solid phases, microscopic examination and algebraic extrapolation of tie-lines sufficed.

The densities reported for some saturated solutions were obtained by means of volumetric pipets calibrated for delivery.

<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>			
Mixtures of sodium fluoride, sodium chlorate, and water were kept for one month at room temperature in tightly closed polyethylene flasks, and then placed in a thermostat at 25°C. The mixtures were stirred using magnetic stirring. Equilibrium was established after 6-8 hours in the thermostat. The chlorate content was determined by adding excess Fe <sup>2+</sup> and back-titrating with permanganate. Fluoride was determined by the zirconium alizarin photolorimetric method. The water content was found by difference.			"Analytically pure" grade NaClO <sub>3</sub> , highly pure grade NaF, and CO <sub>2</sub> -free distilled water were used.

<b>AUXILIARY INFORMATION</b>																																																																																																																								
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of salts and water were thermostated at 20°C for several days, and shaken frequently. Aliquots of the saturated solution were acidified with nitric acid and then titrated with silver nitrate using potassium chromate as an indicator. The compiler assumes that the total salt concentration of the solution was determined gravimetrically, and the chlorate content was determined by difference.  It appears that the NaCl concentrations given in the above data table are initial concentrations (compilers).	<b>SOURCE AND PURITY OF MATERIALS:</b> No information was given.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b> The apparatus is shown in Fig. 1.			<b>SOURCE AND PURITY OF MATERIALS:</b> No information was given.	
			<b>ESTIMATED ERROR:</b> Nothing specified.	
The vessel "a" equipped with a stirrer was sunk in a thermostat and the mixture of salts and water were placed in the vessel. The saturated solution was filtered in a receiver "b" through a siphon-tube. The aliquots of the saturated solution were withdrawn with a pipet. For determination of chlorate, the aliquot was added to excess acidic $\text{FeSO}_4$ solution and titrated with potassium permanganate solution.			<b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>																																																																																											
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of salts and water were stirred in a thermostat for 7 days. Samples of saturated solution were removed with a pipet and weighed. The chlorate ion concentration was determined by the Volhard method after reduction to chloride with zinc and acetic acid. The sodium content was determined by precipitation as the triple acetate of sodium, uranyl and magnesium, according to the method described by Kling and Lasieur (ref 1).	<b>SOURCE AND PURITY OF MATERIALS:</b> No information given.  <b>ESTIMATED ERROR:</b> Large error may be related to the method used for the determ of sodium. The method was tested by the authors and errors ranging from +0.5 % to -32 % were found.  <b>REFERENCES:</b> 1. Kling and Lasieur. <i>Giorn. Chim. Ind. Applicata</i> <u>1925</u> , 7.

<sup>a</sup> A = NaCl·2H<sub>2</sub>O; B = NaCl; C = NaClO<sub>3</sub>; I = Ice

**COMPONENTS:**

(1) Sodium chloride; NaCl; [7647-14-5]

(2) Sodium chlorate; NaClO<sub>3</sub>; [7775-09-9]

(3) Water; H<sub>2</sub>O; [7732-18-5]

**ORIGINAL MEASUREMENTS:**

Nallet, A.; Paris, R.A.

*Bull. Soc. Chim. Fr.* 1956, 488-94.

**VARIABLES:**

Composition

T/K = 246.90 to 373

**PREPARED BY:**

Hiroshi Miyamoto

**EXPERIMENTAL VALUES:**

**METHOD/APPARATUS/PROCEDURE:**

Mixtures of salts and water were placed in bottles and agitated in a thermostat for 2 hours at 100°C, and for 2 hours or more at a lower temperature.

Equilibrium was approached from super-saturation.

The chloride ion concentration was determined by a potentiometric method using silver nitrate solution. After the determination of the chloride, the chlorate was reduced with Mohr's salt in mineral acids, and the excess Fe(II) titrated with potassium dichromate solution.

The sodium content was determined in duplicate by flame photometry.

The nature of the solid phase was determined by Schreinemakers' residues method.

The densities of the saturated solutions were also determined.

**SOURCE AND PURITY OF MATERIALS:**

Sodium chlorate was recrystallized twice and dried. The purity of the sodium chlorate was 99.9%. Sodium chloride was prepared by passing HCl gas through sodium carbonate solution.

**ESTIMATED ERROR:**

Soly: precision 0.5% (compiler).

Temp: nothing specified.

<b>AUXILIARY INFORMATION</b> continued....						
<b>METHOD/APPARATUS/PROCEDURE:</b> Original method described in (1). Mixtures of known composition were prepared from the solid salts and distilled water in Pyrex solubility tubes, and were equilibrated by rotation in a large thermostated water-bath at various temperatures for periods of 120 hours or longer. The liquid sample was passed through a glass wool filter without taking the solubility tube or the filter out of the thermostated water-bath. Aliquots of saturated solution were withdrawn with a calibrated pipet having small stopcocks at each end. Procedures for the analysis of chlorate, chloride and alkali were as described in ref (2). The water content was determined by difference. The nature of solid phases was determined by the Schreinemakers' wet residue method.				<b>SOURCE AND PURITY OF MATERIALS:</b> "Analytical reagent" grade sodium chlorate and chloride were used. The impurities in this grade were deemed much too small to affect the solubility determinations. Distilled water was used in all of the experiments.		
				<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K.

<b>AUXILIARY INFORMATION</b>																																																																											
<b>METHOD/APPARATUS/PROCEDURE:</b> The isothermal method was used. Equilibrium was reached in 30 hours. Samples of the solid and liquid phases were analyzed. Chlorate was found by adding an excess of iron(II) sulfate to an aliquot of saturated solution and back-titrating with potassium permanganate. Chloride was determined argentometrically. Sodium was determined by difference. The solid phases were identified by the method of residues and by X-ray diffraction.	<b>SOURCE AND PURITY OF MATERIALS:</b> Sodium chlorate and chloride had a purity of 99.9 % or better.																																																																										
<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K.

## AUXILIARY INFORMATION

## METHOD/APPARATUS/PROCEDURE:

Method similar to that described in (1) where mixtures of known composition were prepared from the solid salts and distilled water in Pyrex solubility tubes. The mixtures were equilibrated by rotation in a large thermostated water-bath at various temperatures for periods of 120 hours or longer. The liquid sample was passed through a glass wool filter without taking the solubility tube or the filter out of the thermostated water-bath. Aliquots of saturated solution were withdrawn with a calibrated pipet having small stopcocks at each end. Procedures for the analysis of chlorite, chlorate and alkali were described in ref (2). The water content was determined by difference. The nature of solid phases was determined by the Schreinemakers' wet residue method.

## SOURCE AND PURITY OF MATERIALS:

C.p. grade sodium chlorate was used. Technical grade sodium chlorite (Mathieson Chemical Co.) was recrystallized three times from distilled water as the trihydrate, and then stored in a cool place in amber bottles. Anal. Found: NaClO<sub>2</sub>, 58.50 %, NaCl, 0.00 %, NaClO<sub>3</sub>, 0.00 %; alkalinity as Na<sub>2</sub>O, 0.06 %; water by difference, 41.44 %. Distilled water was used.

## ESTIMATED ERROR:

Soly: nothing specified.  
Temp: precision ± 0.1 K (authors).

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubilities detd by the usual procedures of stirring, sampling, filtering and temperature control. Starting with complexes of known composition, and analyzing the saturated solutions at equilibrium, the solid phases were determined by the methods of graphical or algebraic extrapolation and occasional analyses of wet and centrifuged residues. The analytical method for the saturated solutions depended on the combined percentage of the NaClO <sub>3</sub> and NaBrO <sub>3</sub> . For large NaBrO <sub>3</sub> compositions, solutions were analyzed by evaporation, and iodometric titration of the bromate with thiosulfate solution, thus allowing the calculation of the percentage of the chlorate by difference. In the presence of a large amount of chlorate, small quantities of bromate were determined as follows: to about 100 ml of solution was added sodium iodide, 5 g (20 ml of 25 % solution) giving a concentration of 0.33N after dilution to 100 ml and 1.5 ml of concentrated HCl (0.18 to 0.2N after dilution). After waiting 1.5 min, the sln  continued.....			<b>SOURCE AND PURITY OF MATERIALS:</b> Sodium bromate was purified by recrystallization. Sodium chlorate contained small amounts of the corresponding bromate; this bromate content was determined by iodometric titration, and the necessary corrections were then made when the dry chlorates are weighed out for the preparation of the ternary complexes.		
			<b>ESTIMATED ERROR:</b> Soly: precision 0.05 %. Temp: nothing specified.

<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. At 25°C complexes of known compn seeded and stirred for up to 60d, and mean error in compn of solid phases was 1%. At 50°C equil was readily attained and mean error in solid phase compn was 0.09%. More precise solid phase compns at 25°C obtained by first dissolving $\text{NaIO}_3 \cdot \text{H}_2\text{O}$ followed by addn of $\text{NaClO}_3$ , seeding with the monohydrate, and stirring for at least 6 d. At 50°C metastability for anhyd and hydrated $\text{NaIO}_3$ easily maintained, in the first case by starting with anhyd salt and not seeding, and in the second case by starting with the hydrate and seeding. Filtered samples of satd sln analyzed for iodate by titrn with std thiosulfate in the presence of excess KI and acetic acid: titrn error was 1 part in 3000. Total solids detd by evapn to dryness, and $\text{NaClO}_3$ detd by difference. Solid phase compn detd by algebraic extrapolation of tie-lines. The mean error of 1% in compn at 25°C indicates existence of the anhyd salt even after 60 d of stirring. This problem was eliminated by first preparing the sln with the hydrate as described above. (continued)				<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade sodium iodate recrystallized, and dried at 100-110°C. Analysis by titrn with std thiosulfate sln showed it to be 100.0% pure. C.p. grade sodium chlorate was powdered and dried at 150-200°C.		
				<b>ESTIMATED ERROR:</b> Soly: precision $\pm 0.04\%$ . Solid phase compn: see discussion at left. Temp: precision $\pm 0.01\text{ K}$ .		
				<b>METHOD/APPARATUS/PROCEDURE: (Continued)</b> Densities of satd slns at 25°C detd by means of pipets calibrated for delivery.		

## COMPONENTS:

- (1) Sodium chlorate;  $\text{NaClO}_3$ ; [7775-09-9]  
 (2) Sodium iodate;  $\text{NaIO}_3$ ; [7681-55-2]  
 (3) Water;  $\text{H}_2\text{O}$ ; [7732-18-5]

## ORIGINAL MEASUREMENTS:

Ricci, J. E.

J. Am. Chem. Soc. 1938, 60, 2040-3.

## EXPERIMENTAL VALUES: (Continued)

<b>AUXILIARY INFORMATION</b>																												
<b>METHOD/APPARATUS/PROCEDURE:</b> At 0°C mixts were sealed in Pyrex bottles which were fastened to a rotor suspended in a glycerol/water bath. At 40°C mixts were placed in 250 ml 3-neck flasks and thermostated in a water bath. The slns were stirred with glass stirrers provided with mercury seals.  Preliminary experiments identified mixtures which result in satd solutions, several of which were used to prepare the solutions reported in the data table above. Only the compositions of two solutions were reported.  Equilibrated slns were sampled by withdrawing aliquots with pipets fitted with cotton plugs. After determining densities the solutions were diluted for analyses.  Chlorate detd by the method of Dietz as described in (1). Sodium was detd by pptn with zinc uranyl nitrate, and potassium detd by calculation based on stoichiometry. Water was found by difference.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade salts were used without further purification.  The chlorates were found to be 99.9 % pure.  <b>ESTIMATED ERROR:</b> Soly: nothing specified but probably poor due to method of analysis of Na. Temp: at 0°C precision = ± 0.1 K. at 40°C precision = ± 0.05 K.  <b>REFERENCES:</b> 1. Kolthoff, I.M.; Furman, N.H. <i>Volumetric Analysis, Vol II.</i> <u>1929</u> , 388.

## VARIABLES:

Composition  
T/K = 255.30 to 373

## PREPARED BY:

Hiroshi Miyamoto

## EXPERIMENTAL VALUES:

## METHOD/APPARATUS/PROCEDURE:

Mixtures of salts and water were placed in bottles and agitated in a thermostat for 2 hours at 100°C, and for 2 hours or more at a lower temperature. Equilibrium was approached from super-saturation. The chlorate was reduced with Mohr's salt in mineral acids, and the excess Fe(II) titrated with potassium dichromate solution. The analyses of cations were performed in duplicate. The potassium and sodium contents were determined by flame photometry, and also the potassium was determined gravimetrically with sodium tetraphenylborate. The nature of the solid phase was determined by Schreinemakers' residues method. The densities of the saturated solutions were also determined.

## SOURCE AND PURITY OF MATERIALS:

Sodium and potassium chlorate were recrystallized twice. The purity of the chlorates was 99.9 %.

## ESTIMATED ERROR:

Soly: precision 0.5 % (compiler).  
Temp: nothing specified.

<sup>a</sup> A = RbClO<sub>3</sub>; B = NaClO<sub>3</sub>

<sup>b</sup> For binary systems the compiler computes the following:

$$\text{soly of RbClO}_3 = 0.406 \text{ mol kg}^{-1}$$

$$\text{soly of NaClO}_3 = 9.504 \text{ mol kg}^{-1}$$

**AUXILIARY INFORMATION****METHOD/APPARATUS/PROCEDURE:**

The isothermal method was used. Equilibrium reached in 30 hours. Samples of solid and liquid phases were analyzed. Rubidium was determined as the tetraphenylborate or when at low concentration, by flame photometry. Chlorate was found by adding an excess of iron(II) sulfate to an aliquot of saturated solution and back-titrating with potassium permanganate. Sodium was determined by difference. The solid phases were identified by the method of residues, and by X-ray diffraction.

**SOURCE AND PURITY OF MATERIALS:**

Sodium chlorate and rubidium chlorate had a purity of 99.9 % or more.

**ESTIMATED ERROR:**

Soly: nothing specified.  
 Temp: precision  $\pm 0.1$  K.

**COMMENTS AND/OR ADDITIONAL DATA:**

The phase diagram is given below (based on mass % units).

## AUXILIARY INFORMATION

## METHOD/APPARATUS/PROCEDURE:

Mixtures prep'd by weight and rotated in a thermostat at the specified temperature. About three days were required to reach equilibrium. Samples for analysis withdrawn with pipets fitted with filter paper. Sodium chromate in the presence of sodium chlorate was det'd volumetrically as follows: the chromate was ppt'd by addn of barium chloride. The precipitate was filtered, dissolved in HNO<sub>3</sub>, and the chromate titrd with thiosulfate solution. Sodium chlorate det'd by difference from the percentage of total solid obtained by evaporation of the sat'd solution at 110°C. To supplement the indirect det'n of chlorate, direct gravimetric analysis carried out by reduction of chlorate with SO<sub>2</sub> followed by pptn of chloride as AgCl.

The solubility result given in parenthesis in the above table was determined by evaporation.

## SOURCE AND PURITY OF MATERIALS:

C.p. grade sodium chlorate was used and found to be 100.0 % pure by reduction and precipitation. Sodium chromate tetrahydrate (Mackay Co.) was used; the percentage of Na<sub>2</sub>CrO<sub>4</sub> found by titration was 69.15 % and by dehydration 69.25 % as compared with the theoretical value of 69.21 %.

## ESTIMATED ERROR:

Soly: accuracy within ± 0.05 % (authors).  
Temp: precision ± 0.02 K.

<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>			
The solubilities were determined by stirring complexes of known compositions in Pyrex tubes and sampling the equilibrated solutions by means of calibrated pipets fitted with filtering tips. One sample of saturated solution was analyzed by evaporating and drying to constant weight at 125°C to obtain the combined percentage of the two salts. A second sample was used for the determination of molybdate by precipitation of silver molybdate followed by a Volhard titration of the excess silver in the filtrate.			C.p. grade sodium molybdate dihydrate was used. The salt was completely dehydrated by heating at 180°C, and stored at 150°C. The purity of this anhydrous salt was found to be 100%. C.p. grade sodium chlorate was found to be pure within 1/1000 by reduction to chloride and the determination of the chloride by the Volhard method.			
			<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.04$ K.

<b>AUXILIARY INFORMATION</b>																																																																		
<b>METHOD/APPARATUS/PROCEDURE:</b> Ternary mixtures, AgClO <sub>3</sub> -NaClO <sub>3</sub> -H <sub>2</sub> O, of known composition were allowed to come to equilibrium at 25°C after two weeks of stirring. The results were unchanged after 1 to 3 weeks of further stirring. The saturated liquid solution was filtered and sampled for analysis. One sample was titrated for silver with standard KSCN solution and one was evaporated to dryness at 110-125°C, for total salt content whereupon NaClO <sub>3</sub> was calculated by difference.	<b>SOURCE AND PURITY OF MATERIALS:</b> AgClO <sub>3</sub> was made from C.P. AgNO <sub>3</sub> and C.P. NaClO <sub>3</sub> . After three recrystallizations, the product was 99.72 % pure (on the basis of gravimetric determination of silver as AgCl after reduction with NaNO <sub>3</sub> in the presence of some NaCl).  <b>ESTIMATED ERROR:</b> Nothing specified in original article. Solubility: ± 0.03 mass % (compiler). Temp: precision probably better than ± 0.1 K (compiler).  <b>REFERENCES:</b>																																																																	

## COMPONENTS:

- (1) Sodium chlorate;  $\text{NaClO}_3$ ; [7775-09-9]
- (2) Silver chlorate;  $\text{AgClO}_3$ ; [7783-92-8]
- (3) Water;  $\text{H}_2\text{O}$ ; [7732-18-5]

## ORIGINAL MEASUREMENTS:

Ricci, J. E.; Offenbach, J. A.  
*J. Am. Chem. Soc.* 1951, *73*, 1597-9.

## EXPERIMENTAL VALUES: (Continued)

The phase diagram is presented below.

The limiting compositions of SSI and SSII are estimated as  $\sim 37$  mass %  $\text{NaClO}_3$  in SSI and  $\sim 26$  mass %  $\text{AgClO}_3$  in SSII. The composition of the isothermally invariant liquid saturated with these two limiting solid solutions is 2.15 mass %  $\text{AgClO}_3$  and 46.55 mass %  $\text{NaClO}_3$ .

<b>COMPONENTS:</b> (1) Sodium chlorate; NaClO <sub>3</sub> ; [7775-09-9] (2) Urea; CH <sub>4</sub> N <sub>2</sub> O; [57-13-6] (3) Water; H <sub>2</sub> O; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Nabiev, M.N.; Tukhtaev, S.; Musaev, N.Yu.; Kuchrov, Kh.; Shammassov, R.E. <i>Zh. Neorg. Khim.</i> 1982, 27, 2704-6; <i>Russ. J. Inorg. Chem. (Engl. Transl.)</i> 1982, 27, 1533-4.
<b>VARIABLES:</b> T/K = 248.4 to 354.8 Composition	<b>PREPARED BY:</b> Hiroshi Miyamoto and Mark Salomon

<sup>a</sup> I = Ice;    A = CO(NH<sub>2</sub>)<sub>2</sub>;    B = NaClO<sub>3</sub>.

<sup>b</sup> For the binary system at - 18.5°C the compiler computes the following:

$$\text{solv of NaClO}_3 = 6.78 \text{ mol kg}^{-1}$$

#### AUXILIARY INFORMATION

**METHOD/APPARATUS/PROCEDURE:**  
 The method of isothermal sections was used.  
 Eight internal sections were employed.  
 No other information given.

**SOURCE AND PURITY OF MATERIALS:**  
 "Chemically pure" grade potassium chlorate  
 and urea were twice recrystallized from  
 water. No other information given.

**ESTIMATED ERROR:**  
 Nothing specified.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures were placed in glass bottles and agitated in a thermostat at the desired temperature for 1.5 to 5.5 h. After equilibrium was established the slns were allowed to settle in the thermostat for one h or more. Aliquots were analyzed for Cl <sup>-</sup> , ClO <sub>2</sub> <sup>-</sup> , and ClO <sub>3</sub> <sup>-</sup> . The solution was weighed, and chloride detd by pptn using silver nitrate sln. The chlorite concn in slns containing chlorite and chlorate was detd by iodometric titration after addn of dilute acetic acid. To another sample of solution, sulfuric acid and Fe(II) sulfate solution were added and the excess Fe(II) titrd with potassium permanganate sln, and the chlorate content calculated by difference. The weight of NaCl, NaClO <sub>2</sub> and NaClO <sub>3</sub> was calculated from the solubility data, and the water content was determined by difference.			<b>SOURCE AND PURITY OF MATERIALS:</b> "Chemically pure" grade sodium chloride and chlorite were used without further purification. Sodium chlorate of purity 85 % or better was recrystallized, and the product NaClO <sub>3</sub> ·3H <sub>2</sub> O obtained.		
			<b>ESTIMATED ERROR:</b> Nothing specified.

<b>EXPERIMENTAL VALUES:</b>  The details of solubility data were not described in the original article. The experimental and calculated solubilities were shown in figures only.  The phase diagrams of the eutectic point of the quaternary NaClO <sub>3</sub> -NaClO <sub>2</sub> -NaCl-H <sub>2</sub> O system are given as below (based on mass %). <div style="display: flex; justify-content: space-around; align-items: center;">   </div>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> Probably, the isothermal method was used. The ions ClO <sub>3</sub> <sup>-</sup> , ClO <sub>2</sub> <sup>-</sup> and Cl <sup>-</sup> were determined in the presence of one another as follows: the chlorite content was determined iodometrically, the sum of the ClO <sub>2</sub> <sup>-</sup> and ClO <sub>3</sub> <sup>-</sup> ion concentrations by permanganate in a strongly acidic medium. The chlorate content was determined by difference. The chloride ion concentration was determined in a neutral medium by Mohr's method.	<b>SOURCE AND PURITY OF MATERIALS:</b> No information was given in the original paper.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>									
<b>METHOD/APPARATUS/PROCEDURE:</b> Method similar to that described in (1) where mixtures of known composition were prepared from the solid salts and distilled H <sub>2</sub> O. Pyrex solubility tubes used. The mixtures of solid and liquid were equilibrated by rotation in a large thermostated water-bath at various temperatures for periods of 120 hours or longer. The liquid sample was passed through a glass wool filter without taking the solubility tube or the filter out of the thermostated water-bath. Aliquots of saturated solution were removed by means of a calibrated pipet having small stopcocks at each end. Procedures for the analysis of chloride, chlorite, chlorate and alkali were described in ref (2). The Schreinemakers' wet residue method was used to detn solid phase compositions.					<b>SOURCE AND PURITY OF MATERIALS:</b> "Analytical reagent" grade sodium chlorate and chloride were used. Technical grade sodium chlorite (Mathieson Chemical Co.) was recrystallized three times from distilled water as the trihydrate, and then stored in a cool place in amber bottles. Distilled water was used.				
					<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K (authors).

<sup>a</sup> The w function is the moles of water divided by the sum of the moles of sodium chlorate, sodium chlorite and sodium chloride.

<sup>b</sup> A = NaClO<sub>2</sub>·3H<sub>2</sub>O; B = NaClO<sub>2</sub>; C = NaClO<sub>3</sub>; D = NaCl

<sup>c</sup> For the binary system the compiler computes the following:

soly of NaClO<sub>3</sub> = 1.711 mol kg<sup>-1</sup> at 30°C

<b>AUXILIARY INFORMATION</b>																																							
<b>METHOD/APPARATUS/PROCEDURE:</b> At 0°C mixts were sealed in Pyrex bottles which were fastened to a rotor suspended in a glycerol/water bath. At 40°C mixts were placed in 250 ml 3-neck flasks and thermostated in a water bath. The slns were stirred with glass stirrers provided with mercury seals.  Preliminary experiments identified mixtures which result in satd solutions, several of which were used to prepare the solutions reported in the data table above. The compositions of four solutions were reported.  Equilibrated slns were sampled by withdrawing aliquots with pipets fitted with cotton plugs. After determining densities the solutions were diluted for analyses.  Chloride was detd by a modified Volhard method (1), and chlorate detd by the method of Dietz as described in (2). Sodium was detd by pptn with zinc uranyl nitrate, and potassium was detd by calculation based on stoichiometry. Water was found by difference.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade salts were used without further purification.  The chlorates were found to be 99.9 % pure.  <b>ESTIMATED ERROR:</b> Soly: nothing specified but probably poor due to method of analysis of Na. Temp: at 0°C, precision is ± 0.1 K. at 40°C, precision is ± 0.05 K.  <b>REFERENCES:</b> 1. Caldwell, J.R.; Moyer, H.V. <i>Ind. Eng. Chem. Anal. Ed.</i> <u>1935</u> , <i>7</i> , 38. 2. ## AUXILIARY INFORMATION

## METHOD/APPARATUS/PROCEDURE:

The isothermal method was used. Equilibrium was reached in 30 hours. Samples of solid and liquid phases were analyzed, rubidium being determined as the tetraphenylborate or when at lower concentration, by flame photometry, and chloride determined argentometrically. Chlorate was found by adding an excess of iron(II) sulfate to an aliquot of saturated solution and back-titrating with potassium permanganate. Sodium was determined by difference. The solid phases were identified by the method of residues and by X-ray diffraction.

## SOURCE AND PURITY OF MATERIALS:

The NaCl, NaClO<sub>3</sub>, RbCl and RbClO<sub>3</sub> had a purity of <99.9 %.

## ESTIMATED ERROR:

Soly: nothing specified.  
Temp: precision ± 0.1 K.

**AUXILIARY INFORMATION****METHOD/APPARATUS/PROCEDURE:**

Solubility was investigated by the isothermal method by mixing the solid and liquid phases in glass test-tubes in a water thermostat.

Samples of liquid and solid phases were analyzed for the anions and cesium. Chloride was titrated with silver nitrate solution by using potassium chromate as indicator. Chlorate was found by adding excess iron(II) sulfate to an aliquot of saturated solution and back-titrating with potassium permanganate solution. Cesium was determined gravimetrically as cesium tetraphenylborate. Sodium was found by difference. The solid phases were identified by the method of residues, and X-ray diffraction.

**SOURCE AND PURITY OF MATERIALS:**

"Chemically pure" grade NaCl, NaClO<sub>3</sub>, CsCl and CsClO<sub>3</sub> with a purity of 99.5 % or better were used.

**ESTIMATED ERROR:**

Soly: nothing specified.  
 Temp: precision ± 0.1 K.

<b>AUXILIARY INFORMATION</b>															
<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions were prepared in an Erlenmeyer flask by mixing the dried acetone with an excess of halate for two hours. The solution was constantly stirred by bubbling dry air (air was dried by passing it through CaCl <sub>2</sub> while pumping it into the solution). Air going out from the flask after bubbling in the solution carried some acetone vapor during this operation. The solution temperature was kept constant by immersing the flask in a constant temperature water bath. After two hours, the air exit was closed. The resulting pressure forced the saturated solution from the Erlenmeyer through a tube filled with cotton (which acted as a filter) and was collected in a small flask. This flask was stoppered and weighed. The halate contained in the sample was weighed after complete evaporation of acetone. In all cases, weights were reported to the fourth decimal figure.	<b>SOURCE AND PURITY OF MATERIALS:</b> Commercial redistilled acetone. This acetone was then dehydrated three times by leaving it in contact with calcium chloride for forty eight hours each time. Fresh CaCl <sub>2</sub> was used in each operation. Finally the dehydrated acetone was distilled at 56.3°C. Source and purity of NaClO <sub>3</sub> not specified.														
<b>ESTIMATED ERROR:</b> Nothing specified.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> The solvent and excess solid were sealed in soft glass test-tubes and rotated for at least one week in a water thermostat at 25°C. All analyses were made on a weight basis by use of weighing pipets. Both the standard gravimetric determination of chloride and the volumetric method, using dichlorofluorescein as an indicator, were used. The chlorate was reduced to the chloride by boiling with excess sulfurous acid.	<b>SOURCE AND PURITY OF MATERIALS:</b> Ethylenediamine was dehydrated and purified by the method given in ref. 1. Analytical grade NaClO <sub>3</sub> was used.				
<b>ESTIMATED ERROR:</b> Soly: precision within 0.5 % Temp: precision ± 0.08 K.

<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> Excess salt and solvent were sealed in 5 ml glass ampules and equilibrated at 40°C for 250-300 hours with periodic shaking. 1 ml aliquots were transferred in the laboratory atmosphere to 1/2 dram polyethylene vials and sealed. These 1/2 dram vials were then sealed in 2 dram vials, and the chloride content determined by neutron activation ( $^{38}\text{Cl}$ activity). Each sample was irradiated twice for 30 minutes at neutron fluxes of $2.8 \times 10^{10}$ and $5.6 \times 10^9$ neutrons $\text{cm}^{-2} \text{sec}^{-1}$ . A calibration plot of $^{38}\text{Cl}$ activity vs chloride concentration was used for the analyses.  After each activation the 1/2 dram vials were placed in new 2 dram vials, and $\gamma$ -radiation counted in a NaI(Tl) well detector coupled to a 400 channel analyzer. Both the 1.64 and 2.16 MeV peaks were used for the analyses, and were corrected for Compton scattering and decay. Where interferences were noted, only one $\gamma$ -ray was used.	<b>SOURCE AND PURITY OF MATERIALS:</b> Sulfolane (Shell Chemical Co.) was distilled twice under vacuum at temperatures less than 100°C. The purified solvent was found to contain less than 0.02 mass % water by Karl Fischer titration.  Reagent grade $\text{NaClO}_3$ was used.  <b>ESTIMATED ERROR:</b> Soly: precision about $\pm 15\%$ (compiler). Temp: precision $\pm 0.5$ K.  <b>REFERENCES:</b>

<b>VARIABLES:</b> Room temperature (Compiler's assumption)	<b>PREPARED BY:</b> Mark Salomon and Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b> <p>The solubility of NaClO<sub>3</sub> in hydrazine at room temperature was given as:</p> <p style="text-align: center;">0.66 g/1 cm<sup>3</sup> N<sub>2</sub>H<sub>4</sub></p> <p>The authors stated that the chief object of the research was to obtain qualitative and approximate quantitative data, and the temperature was not kept constant.</p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> <p>The solubility vessel was a glass tube to which a U-shaped capillary tube was attached to the bottom. A stopcock at the end of the capillary permitted the adjustment of the rate of flow of dry nitrogen. About 1 cc of anhydrous hydrazine was placed in the tube, and small amounts of NaClO<sub>3</sub> added from weighing bottle.</p> <p>After each addition of NaClO<sub>3</sub>, a loosely fitting cork was placed in the top of the solubility tube. Nitrogen was bubbled through solution until the salt dissolved. The process was repeated until no more salt would dissolve. Temperature was not kept constant.</p> <p>The accuracy in this method is very poor. In addition the authors stated that it was difficult to prevent the oxidation of hydrazine.</p>	<b>SOURCE AND PURITY OF MATERIALS:</b> <p>Anhydrous hydrazine was prepd by first partially dehydrating commercial hydrazine with sodium hydroxide according to the method of Raschig (1). Further removal of water by distillation from barium oxide after the method of de Bruyn (2). The distillation apparatus employed and the procedure followed in the respective distillation were those described by Welsh (3). The product was found on analysis to contain 99.7 % hydrazine. The hydrazine was stored in 50 cm<sup>3</sup> sealed tubes. Sodium chlorate was the ordinary pure chemical of standard manufacture.</p> <b>ESTIMATED ERROR:</b> Soly: accuracy ± 50 % at best (compilers).

<p>CRITICAL EVALUATION: THE BINARY SYSTEM</p> <p>Data for the solubility of potassium chlorate in water have been reported in 23 studies (1-23). Five studies (2, 5, 9, 15, 16) deal solely with the binary system, three studies (3, 7, 11) report solubilities in water-organic solvent mixtures, and the remaining studies deal with multicomponent systems. Most studies are based on isothermal measurements with chemical analyses either gravimetrically (3, 5, 7, 11) or by titration of chloride after reduction of the chlorate (6, 11-13, 20-23). One high temperature study by Benrath et al. (15) used the synthetic method.</p> <p>Mellor (24) has cited a number of studies which are unavailable to the compilers and evaluators, and hence have not been included in this volume. The studies cited by Mellor are: Gay Lussac (25), Mulder (26), Geradin (27), Nordenshjoeld (28), Schlosing (29) Blarez (30), Arrhenius (31), Etarde (32) and Calvert (33).</p> <p>In all studies including those for multicomponent systems, no hydrates of <math>KClO_3</math> were reported. It is therefore concluded that the anhydrous salt is the solid phase over the temperature range of 273 - 578 K. A summary of all the binary solubility data is given in Table 1. In this table we list the solubilities in mole fraction units (calculated by the evaluators), and the solubilities in mol <math>kg^{-1}</math> units can be found in the compilations. Also included in Table 1 are the weighting factors used in fitting the data to the smoothing equations. A weight of (1) or (0) was given depending whether the specified result was included or omitted, respectively. We considered giving higher weight factors to data of higher precision (13, 14, 17-19, 22), but doing so would have resulted in the rejection of important data of less precision, mainly those of Pawlowsky (1). Data were rejected from the smoothing equation fit when the difference between the calculated and observed mole fraction solubilities exceeded twice the standard error of estimate: i.e. when</p> $\text{abs } [X_{\text{obsd}} - X_{\text{calcd}}] > 2\sigma_x$ <p>Two smoothing equations were used. For mole fractions we used</p> $Y_x = A/(T/K) + B\ln(T/K) + C + D(T/K) \quad [1]$ <p>and for molalities we used</p> $Y_m = A/(T/K) + B\ln(T/K) + C \quad [2]$ <p>The complex Y terms in eqs. [1] and [2] are defined in the PREFACE to this volume and in the <math>LiClO_3</math>-<math>H_2O</math> and <math>RbClO_3</math>-<math>H_2O</math> critical evaluations. The resulting smoothing equations based on fitting only those solubilities between 273-373 K are given in eqs. [3] and [4] below. The smoothed solubilities at rounded temperatures are given in Table 2 and are designated as <i>recommended</i> values.</p> $Y_x = -60986.171/(T/K) - 328.4915\ln(T/K) + 1925.070 + 0.4819091(T/K) \quad [3]$ $\sigma_y = 0.023 \quad \sigma_x = 0.00023$ $Y_m = -6472.065/(T/K) - 11.3302\ln(T/K) + 86.2555 \quad [4]$ $\sigma_y = 0.020 \quad \sigma_m = 0.049$

363.2	3.641	0.06341
368.2	3.972	0.07049
373.2	4.314	0.07839

The data of Benrath et al. (15) were also fitted to the smoothing eq. [1]:

$$Y_x = -6275.39/(T/K) - 6.4129 \ln(T/K) + 49.9386 + 0.0024454(T/K) \quad [5]$$

$$\sigma_y = 0.009$$

$$\sigma_x = 0.003$$

We tried to extrapolate eq. [5] to the melting point of  $KClO_3$  (i.e. calculate the temperature for  $\chi = 1.00$ ), but found a value of 608.4 K. The literature value of the melting point of  $KClO_3$  is 641.6 K (45). The solubility at 373.2 K calculated from eq. [5] is  $\chi = 0.0749$  which is much too low (see Table 2), and again suggests caution in using eq. [5] to compute solubilities outside the range of temperatures used in the least squares fit to this equation. As indicated in Table 1, the temperature range used to derive eq. [5] is 450-578 K.

<p>COMPONENTS:</p> <p>(1) Potassium chlorate; <math>KClO_3</math>; [3811-04-9]</p> <p>(2) Water; <math>H_2O</math>; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>Hiroshi Miyamoto Department of Chemistry Niigata University Niigata, Japan</p> <p style="text-align: right;">July, 1984</p>
<p>CRITICAL EVALUATION:</p> <p style="text-align: center;">TERNARY SYSTEMS</p> <p>Many studies for solubilities of potassium chlorate in aqueous ternary systems with saturating inorganic compounds have been reported. Some studies for solubilities in aqueous-organic solvent mixtures and in the presence of non-saturating components have also been reported. A summary of studies on aqueous ternary systems is given in Table 3. In general, the solubility of potassium chlorate is depressed by the addition of other potassium salts or by the addition of other chlorates.</p> <p>1. One Saturating Component</p> <p>Bronsted (5) measured solubilities in aqueous potassium hydroxide solutions over the KOH concentration range from 4.71 to 15.02 mol dm<sup>-3</sup>. The solubility of potassium chlorate in aqueous KOH solution decreases with increasing concentration of KOH.</p> <p>The solubility of potassium chlorate in ethanol-water mixtures has been measured by Taylor (10) at 303 and 313 K, and by Wright (7) at 293 and 373 K. The solubility in acetone-water mixtures have been studied by Taylor (3) at 303 and 313 K, and by Hartley (11) at 298 K. The solubility in glycerol containing low concentrations of water at 292 K was reported by Holms (33). The solubility of potassium chlorate in these mixtures decreases with increasing concentration of organic solvent.</p> <p>Schnellbach and Rosin (37) measured the solubility of potassium chlorate in aqueous glycine solution. The solubility of potassium chlorate in aqueous solution containing glycine is higher than that of potassium chlorate in water.</p> <p>2. Two Saturating Components</p> <p><u>Systems with halides.</u> The data for the aqueous ternary systems have been reported in 12 publications (4, 8, 10, 12, 14, 20, 23, 39-41, 42, 45) (see Table 3).</p> <p>Solubilities in the <math>NaCl - KClO_3 - H_2O</math> system were reported by Di Capua and Scaletti (8) and Nallet and Paris (42). Only one point at each temperature investigated was reported in both papers. Above 283 K the composition of the solid phase was pure <math>KClO_3</math> and <math>NaCl</math>.</p> <p>Solubilities in the ternary <math>KClO_3 - KCl - H_2O</math> system have been reported in 9 publications (4, 8, 12, 20, 23, 39-41). Neither double salts nor solid solutions are formed.</p> <p>Donald (39), Munter and Brown (41), and Nallet and Paris (42) studied the compositions of the solutions only at the ternary isothermally invariant point. These results and those of other investigators (8, 12, 20, 23) are summarized in Table 4. Mutter and Brown (41) stated that the result of Di Capua and Scaletti (8) have mistaken the sharp curvature of the potassium chlorate solubility isotherm in the range of low potassium chloride concentration as an indication of the location of the invariant point. The evaluators agree that there is a serious error in (8), and the data for this system have been rejected and the paper was not compiled.</p> <p>Benrath and Braun (40) measured solubility in the ternary <math>KClO_3 - KCl - H_2O</math> system at 473, and 523 K. The solid phases at these temperatures were similar to those at temperatures of 373 K or below.</p> <p>Ricci (14) measured solubilities in the ternary systems <math>KClO_3 - KBr - H_2O</math> and <math>KClO_3 - KI - H_2O</math> at 298 K. The only solid phases in these systems are the pure anhydrous salts.</p> <p><u>Systems with other halates.</u> Mazzetti (10) measured solubilities for the ternary <math>KClO_3 - Ca(ClO_3)_2 - H_2O</math> system at 293 K, and Kirgintsev, Kashina, Vulikh and Korotkevich (21) for the ternary systems <math>KClO_3 - RbClO_3 - H_2O</math> and <math>KClO_3 - CsClO_3 - H_2O</math> at 298 K. Neither double salts nor solid solutions form in these systems.</p>

$KClO_3 + KBr + H_2O$	298	$KClO_3$ ; $KBr$	14
$KClO_3 + KI + H_2O$	298	$KClO_3$ ; $KI$	14

Swenson and Ricci (17) studied solubilities in the ternary system  $KClO_3$ - $KBrO_3$ - $H_2O$  at 298 K. In the system two salts dissolve to a limited extent in each other, forming two solid solutions containing up to 3 %  $KClO_3$  in  $KBrO_3$  and up to 5%  $KBrO_3$  in  $KClO_3$ .

Karnakhov, Lepeshkov and Fursova (44) measured solubilities in the ternary  $KClO_3$ - $KClO_4$ - $H_2O$  system at 298 K. Potassium perchlorate has a great tendency to form solid solutions with potassium chlorate.

Table 4. Composition at Isothermally Invariant Points in the System  $KClO_3$ - $KCl$ - $H_2O$

MULTICOMPONENT SYSTEMS			
<p>Although Di Capua and Scaletti (8) studied solubility in the quaternary system <math>KClO_3</math>-<math>KCl</math>-<math>NaCl</math>-<math>H_2O</math> at 298 K, they reported only one value.</p>			
<p>Mazzetti (10) studied the <math>KClO_3</math>-<math>KCl</math>-<math>Ca(ClO_3)_2</math>-<math>H_2O</math> system at 293 K, but solubility data were only reported for ternary and quaternary systems. In these systems, the solid phases found were the pure components <math>KClO_3</math>, <math>KCl</math>, <math>Ca(ClO_3)_2 \cdot 2H_2O</math>, <math>CaCl_2 \cdot 6H_2O</math> and <math>CaCl_2 \cdot 4H_2O</math>.</p>			
<p>Arkhipov, Kashina and Kuzina (23) studied the <math>KClO_3</math>-<math>KCl</math>-<math>RbClO_3</math>-<math>RbCl</math>-<math>H_2O</math> system at 298 K but only reported solubility data for the quaternary systems <math>KClO_3</math>-<math>KCl</math>-<math>RbClO_3</math>-<math>H_2O</math>, <math>KClO_3</math>-<math>KCl</math>-<math>RbCl</math>-<math>H_2O</math> and <math>KCl</math>-<math>RbCl</math>-<math>RbClO_3</math>-<math>H_2O</math>, and for the ternary systems <math>KClO_3</math>-<math>KCl</math>-<math>H_2O</math>, <math>KClO_3</math>-<math>RbClO_3</math>-<math>H_2O</math> and <math>RbCl</math>-<math>RbClO_3</math>-<math>H_2O</math>. In the 5 component system, there were three fields on the solubility diagram for the crystallization of the salts <math>KClO_3</math>, <math>RbClO_3</math>, and for the solid solution of potassium and rubidium chloride.</p>			
<p>Karnaukhov, Lepeshkov and Fursova (44) studied solubilities in the quaternary <math>KClO_3</math>-<math>KCl</math>-<math>KClO_4</math>-<math>H_2O</math> system, and also for the ternary systems <math>KCl</math>-<math>KClO_4</math>-<math>H_2O</math>, <math>KClO_3</math>-<math>KCl</math>-<math>H_2O</math> and <math>KClO_3</math>-<math>KClO_4</math>-<math>H_2O</math>. Solid phases found are the pure components <math>KCl</math>, <math>KClO_3</math> and <math>KClO_4</math>, and the solid solutions <math>nKCl \cdot mKClO_4</math> and <math>nKClO_3 \cdot mKClO_4</math>.</p>

<b>AUXILIARY INFORMATION</b>																																																																																									
<b>METHOD/APPARATUS/PROCEDURE:</b> The apparatus for the solubility measurement is shown in the Figure above. The water and potassium chlorate were placed in test tube A. The tube A was equipped with a condenser K and a siphon glass tube C, and connected with a weighing bottle B equipped with a condenser K'. The apparatus was placed into a large thermostated glass beaker. To mix the water and potassium chlorate, air was bubbled through the mixture. After equilibrium was established, the saturated solution in the tube A was filtered into the weighing tube B through the siphon tube C equipped with a cotton wool filter. The apparatus was removed from the large beaker, cooled and/or dried, and bottle B weighed. $KClO_3$ was determined gravimetrically after evaporation of the solvent.	<b>SOURCE AND PURITY OF MATERIALS:</b> No information was given.																																																																																								
	<b>ESTIMATED ERROR:</b> Nothing specified.																																																																																								
	<b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>																		
<b>METHOD/APPARATUS/PROCEDURE:</b> Method of equilibration not specified, but probably the isothermal method was employed. Aliquots of saturated solution for analysis were withdrawn with a pipet. The aliquots were placed in platinum dishes and the water evaporated. The residues were dried at 120°C to constant weight.	<b>SOURCE AND PURITY OF MATERIALS:</b> Potassium chlorate was prepared by treating potassium sulfate with barium chlorate. The product was repeatedly recrystallized until no trace of sulfate and barium was detected. The purity of the salt was checked by volumetrically determining chlorine in the anhydrous chloride dried at 150-160°C. The result was not given.																	
<b>ESTIMATED ERROR:</b> Not possible to estimate due to insufficient data.

<b>METHOD/APPARATUS/PROCEDURE:</b> <p>The apparatus used to determine solubilities at high temperatures is shown in Figs. 1 and 2. A saturation vessel A with a condenser C was connected to an aspirator to reduce the pressure. The constancy and the value of the pressure were regulated by a mercury-regulator R.</p> <p>Very fine crystals of potassium chlorate and water were placed in the vessel A. After reaching a desired pressure by aspirating the system, the vessel A was dipped in an oil-bath whose temperature was kept at a temperature 5-10°C above the boiling point. After the solution boiled and reached saturation, an aliquot for analysis was removed through stopcock C by admitting air through the condenser. The concentration of the solution was determined by evaporation of the solvent or by another method. Details of the other method were not reported.</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p>Fig. 1.</p> </div> <div style="text-align: center;">  <p>Fig. 2.</p> </div> </div>

<b>AUXILIARY INFORMATION</b>																																												
<b>METHOD/APPARATUS/PROCEDURE:</b> An excess of $KClO_3$ and double distilled water were placed into a shaking bottle. The bottle was agitated in a thermostat for about 10 hours. Equilibrium was established from both undersaturation and supersaturation. The saturated solution and solid phase were separated by filtration. Two analytical methods were used to determine the chlorate content in the saturated solution. (1) An aliquot of saturated solution was concentrated by evaporation, and the residue dried at 110°C. (2) The chlorate in an aliquot of saturated solution was reduced to chloride by addition of sulfuric acid. The solution was evaporated and the KCl heated in an open flame to constant weight.	<b>SOURCE AND PURITY OF MATERIALS:</b> The purest commercial $KClO_3$ (Kahlbaum, Berlin) was dissolved in distilled water, and the solution decanted three times to remove any impurity. The recrystallized $KClO_3$ was used for the solubility determinations.  <b>ESTIMATED ERROR:</b> Soly: standard deviation is given in the above data table (compiler). Temp: precision $\pm 0.02$ K (author).  <b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>																
<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions of $KClO_3$ in the $H_2O$ - $D_2O$ mixture were prepared by the method of supersaturation. The supersaturated solutions were made by agitating the excess salt with the mixture for one hour at 60°C; the time of agitation in the 25°C bath was 2 hours. A sample of the clear solution was delivered into a weighing bottle, then the solvent evaporated and the residual pure salt was dried in vacuum at 100°C and weighed.	<b>SOURCE AND PURITY OF MATERIALS:</b> Baker's analyzed c.p. grade potassium chlorate was dried over calcium chloride in a desiccator for several days before use. $D_2O$ content of the water mixture was determined by pycnometer both before and after each measurement. The mole percentage was calculated from the specific gravity at 25°C (ref 1).  <b>ESTIMATED ERROR:</b> Soly: accuracy about 1 % (authors). Temp: precision $\pm 0.03$ K (authors).  <b>REFERENCES:</b> 1. Swift, E. Jr. <i>J. Am. Chem. Soc.</i> <u>1939</u> , 61, 198.

PREPARED BY:

Hiroshi Miyamoto

EXPERIMENTAL VALUES:

METHOD/APPARATUS/PROCEDURE:

The procedure of equilibration and the method for analysis of the saturated solution were not described in the original paper, but the compiler assumes that the procedure and the method were similar to that given in ref (1). See the compilation of this paper for the KCl-KClO<sub>3</sub>-H<sub>2</sub>O system.

SOURCE AND PURITY OF MATERIALS:

The source and purity of materials were not reported in the original paper, but probably similar to that described in ref (1).

ESTIMATED ERROR:

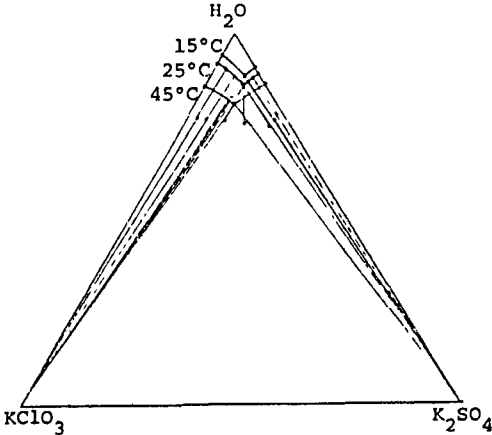

Nothing specified.

<b>AUXILIARY INFORMATION</b>			
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of the salts were placed in Erlenmeyer flasks of capacity about 30 cm <sup>3</sup> with well ground stoppers. Flasks were rotated in a thermostat for about 2 days. When equilibrium was attained, the solutions were permitted to settle in the thermostat and satd solution removed by pipet through a short glass tube with a purified cotton wool filter. Exactly 10 cm <sup>3</sup> of the solution was diluted with about 30 cm <sup>3</sup> of water, treated with 40 cm <sup>3</sup> of 10 % aqueous ferrous fulfate and boiled for about 15 minutes. Aqueous ammonia which was absolutely free from chlorine was added to the solution, and the solution gently boiled until the excess ammonia was expelled. The ppt was filtered and washed 5 times with hot water. The filtrate was used for the determination of chloride by a modified Volhard method (1). Potassium was detd as the sulfate by sulfuric acid as described in (2). The composition of the solid phase was also determined by the same method.		<b>SOURCE AND PURITY OF MATERIALS:</b> Both potassium chlorate and nitrate (Japan Pharmacopeia) were recrystallized three times. Distilled water was used.	
		<b>ESTIMATED ERROR:</b> Nothing specified.

AUXILIARY INFORMATION						
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:			
<p>Weighed mixtures of known composition were brought to equilibrium by stirring at the desired temperature. The time required for attainment of equilibrium was determined by analysis, and required several days. The order of mixing of the components, and the process of seeding or inoculation for required phases had to be varied in accordance with the phase sought.</p> <p>In one sample of the saturated solution, chlorate was determined by the method of Peters and Deutschlander (1): to the chlorate sample (containing about 0.11g of <math>ClO_3^-</math>) is added a definite volume (50 cm<sup>3</sup>) of 0.05 mol dm<sup>-3</sup> arsenious oxide solution. After the addition of a trace of KBr, the solution is acidified strongly with HCl and boiled for ten minutes. The excess arsenious oxide is then titrated by means of 0.033 mol dm<sup>-3</sup> <math>KBrO_3</math> using indigo sulfonic acid indicator.</p> <p style="text-align: center;">continued.....</p>			<p>Nothing specified.</p>

The composition of the solid phase is not given in the original paper.				
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of salts and water were placed into a thermostat at 20°C for several days and shaken frequently. Aliquots of the saturated solution were acidified with nitric acid and then titrated with silver nitrate using potassium chromate as an indicator. The compiler assumes that the total salt concentration of the solution was determined gravimetrically, and that the chlorate content was determined by difference.  It appears that the concentrations of $\text{KCl}$ given in the above data are initial concentrations (compilers).		<b>SOURCE AND PURITY OF MATERIALS:</b> No information was given.		
		<b>ESTIMATED ERROR:</b> Nothing specified.

<b>AUXILIARY INFORMATION</b>																																																																											
<b>METHOD/APPARATUS/PROCEDURE:</b> The mixtures of salts and water were stirred in a thermostat for 7 days. Samples of saturated solutions were withdrawn with a pipet and weighed.  The chlorate ion concentration was determined by the Volhard method after reduction to chloride ion with zinc and acetic acid. Probably, the potassium content was determined by precipitation as the triple acetate of potassium, uranyl and magnesium, according to the method described by Kling and Lasieur (ref 1).	<b>SOURCE AND PURITY OF MATERIALS:</b> No information given.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b> 1. <b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b> The system was studied by the isothermal method. The KClO <sub>3</sub> was added to the solution, saturated with KCl and stirred to establish equilibrium. The chloride content was determined by Volhard's method. For determination of chlorate, a weighed amount of saturated solution was added to excess FeSO <sub>4</sub> solution and titrated with permanganate solution. The densities were also determined.				<b>SOURCE AND PURITY OF MATERIALS:</b> Potassium chlorate and chloride were purchased from Poulence. No other information was given in the paper.		
				<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>		
a 40-50 mg mixture of KCl + KClO <sub>3</sub> and water was placed in a 5 cm long glass tube (inner diam = 1.5 mm) and sealed. The tube was heated in a vertical position at the desired temperature.: the method of ascertaining equilibrium not specified. The tube was then rotated permitting the solution to flow to one end and due to the small diameter of the tube, the solids remained in the other end of the tube. The tube was cooled and broken just below the solid residues. Each part of the tube was weighed and dried by heating to dryness. The dried products were weighed and dissolved in nitric acid, and the chloride content determined gravimetrically by precipitation with silver nitrate.			Nothing specified.		
			<b>ESTIMATED ERROR:</b>		
			Nothing specified.		
			<b>COMMENTS AND/OR ADDITIONAL DATA:</b>		
			Using literature values for solubilities and melting points of 2 component and 1 component systems, the author prepared Janecke phase diagrams and polytherms. From these diagrams the azeotrope points were determined. The phase diagrams are reproduced on the following page. In these diagrams, m is the moles of water per mole of KCl + KClO <sub>3</sub> , and x is the mole fraction of KCl in the total KCl + KClO <sub>3</sub> content.

EXPERIMENTAL VALUES:

METHOD/APPARATUS/PROCEDURE:

Mixtures of salts and water were placed in bottles and shaken in a thermostat for 2 hours at 100°C and for 2 hours or more at lower temperatures. Equilibrium was approached from supersaturation. The chloride ion concentration was determined by a potentiometric method using silver nitrate solution. After the determination of chloride, the chlorate was reduced with Mohr's salt in mineral acids, and the excess Fe(II) titrated with potassium dichromate solution. The analyses of cations were performed in duplicate. The potassium content was determined by flame photometry and gravimetry. The nature of the solid phase was determined by Schreinemakers' residues method. The densities of the saturated solution were also measured.

SOURCE AND PURITY OF MATERIALS:

Potassium chlorate and chloride were recrystallized twice. The purity of the salts was 99.9 %.

ESTIMATED ERROR:

Soly: precision 0.5 % (compiler).  
 Temp: nothing specified.

<b>AUXILIARY INFORMATION</b>																			
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of the solid salts and water sealed in Pyrex bottles were fastened to a rotor suspended in a constant temperature bath. An aq glycerol solution was used as the bath liquid. A preliminary experiment was carried out in which an original mixt of the solid salts and water was gradually augmented by small additions of salt until the density and composition of the resultant solution became constant. From these data, mixtures of the solid salts and water known to result in satd solutions were prepd for the final test. The equilibrated solutions were sampled by withdrawing clear supernatant solution through cotton filtering plugs directly into a density pipet. After determining the density, the samples were diluted. The chloride content was detd by the Volhard method as modified by Caldwell and Moyer (ref 1). The chlorate content was detd by the method of Dietz as described by Kolthoff and Furman (ref 2). The water content was found by difference.	<b>SOURCE AND PURITY OF MATERIALS:</b> All the salts used were of c.p. grade and were used without further purification. The chlorate was found to be average 99.9 % pure.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K (authors).  <b>REFERENCES:</b> 1. Caldwell, J.R.; Moyer, H.V. <i>Ind. Eng. <b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b> The isothermal method was used. The solids (KClO <sub>3</sub> and KCl) and water were placed into glass test-tubes held in a thermostat. The rate of rotation of the test-tubes was 45 rev min <sup>-1</sup> , and equilibrium was reached in 30 hours. Potassium in the liquid phase was analyzed by flame photometry. Chloride was determined by titration of a specimen of the solution with silver nitrate by using potassium chromate as an indicator. The chlorate ion concentration was determined volumetrically by addition of an excess of iron(II) sulfate solution and back-titration of the latter with potassium permanganate solution. The solid phases were identified by the method of residues, crystal optics, and by X-ray diffraction.		<b>SOURCE AND PURITY OF MATERIALS:</b> The purity of KClO <sub>3</sub> and KCl was within 99.9 %.		
		<b>ESTIMATED ERROR:</b> Soly: the relative error in potassium determination by flame photometry did not exceed 3-5 %. Temp: precision ± 0.1 K (authors).

<sup>b</sup> For the binary system the compiler computes the following:

$$\text{soly of } \text{KClO}_3 = 0.7004 \text{ mol kg}^{-1}$$

#### AUXILIARY INFORMATION

##### METHOD/APPARATUS/PROCEDURE:

Mixtures of known composition were stirred in a bath thermostatically controlled at 25°C for at least two days. Potassium bromide was determined by titration with standard silver nitrate solution using Mohr's method. The total solid was determined by evaporation at 100°C followed by heating to 250°C. Potassium chlorate was calculated by difference.

##### SOURCE AND PURITY OF MATERIALS:

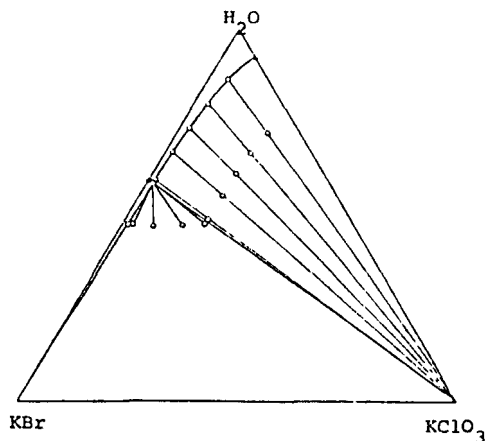

Nothing specified.

##### ESTIMATED ERROR:

Soly: nothing specified.  
Temp: precision ± 0.02 K.

##### COMMENTS AND/OR ADDITIONAL DATA:

The phase diagram is given below (based on mass %).

soly of $\text{KClO}_3$ = 0.6995 mol $\text{kg}^{-1}$						
soly of $\text{KBrO}_3$ = 0.4878 mol $\text{kg}^{-1}$						
<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>			
Solubilities were determined according to the usual procedure insofar as method of stirring, sampling, filtering, density determination, and temperature control are concerned. Starting with complexes of known composition, and analyzing the saturated solutions at equilibrium, the solid phases were then determined by the methods of graphical or algebraic extrapolation, in addition to occasional analyses of wet and centrifuged residues. The analytical method for the saturated solutions depended on the combined percentage of the $\text{KClO}_3$ and $\text{KBrO}_3$ . For large $\text{KBrO}_3$ compositions solutions were analyzed by evaporation, and iodometric titration of the bromate with thiosulfate solution thus allowing the calculation of the percentage of the chlorate by difference. In the presence of a large amount of chlorate, small quantities of bromate were determined as follows. To about 100 ml of solution was added 5 g of sodium iodide (20 ml of 25% solution) giving a concentration of 0.33N after dilution to 100 ml; 1.5 ml of concentrated HCl (0.18 to 0.2N after dilution); titration with 0.2N sodium thiosulfate solution to be started after continued.....			High grade (99.9 %) potassium bromate was used as received. Potassium chlorate contained small amounts of the corresponding bromate; this bromate content was determined by iodometric titration and the necessary corrections were made when preparing the ternary complexes.			
			<b>ESTIMATED ERROR:</b>			
			Soly: precision 2 % (compiler). Temp: nothing specified.

<b>AUXILIARY INFORMATION</b>							
<b>METHOD/APPARATUS/PROCEDURE:</b>				<b>SOURCE AND PURITY OF MATERIALS:</b>			
Mixtures of $KIO_3$ , $KClO_3$ and $H_2O$ were stirred for 5-7 days.				Potassium iodate (c.p. grade) was recrystallized and dried at 100-110°C. Analysis by titration with standard sodium thiosulfate solution showed it to be 100.0 % pure.			
The iodate content was determined by treatment with excess potassium iodide and a limited amount of acetic acid, and titration of the liberated iodine with standard thiosulfate solution. The total dissolved solid was determined by evaporation to dryness, and the chlorate salt calculated by difference.				Potassium chlorate (c.p. grade) was powdered, and then dried at 150-200°C.			
				<b>ESTIMATED ERROR:</b>			
				Soly: nothing specified.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>		
Solubilities were determined by the method of isothermal relief of supersaturation. Weighed amounts of chlorates were dissolved in water in 50 cm <sup>3</sup> test tubes by heating in a water bath at 65-70°C: the test tubes were then placed in a thermostat at 25°C for 20 m. Supersaturation was removed by stirring at a rate of 60 rev min <sup>-1</sup> for 10 h. After settling, 2 samples of liquid phase were removed for analysis. The first was evaporated in a drying cupboard at 70-80°C and dried to constant weight at 105°C. The other sample was analyzed for $ClO_3^-$ by adding $FeSO_4$ solution and back-titrating excess iron(II) with permanganate solution. Solid phase compositions were not reported.			The purity of chlorates used was 99.9 % or better.

<b>AUXILIARY INFORMATION</b>																																																																														
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubility in this system was studied by the isothermal relief of supersaturation method. Weighed amounts of chlorates were dissolved in water in 50 $\text{cm}^3$ test tubes by heating on a water bath at 65-70°C; the test-tubes were then placed in a thermostat at 25°C for 20 min. Supersaturation was then removed by stirring at 60 rpm for 10 h. After settling two samples of liquid phase were removed for analysis. The first was evaporated in a drying cupboard at 70-80°C and then dried to constant weight at 105°C. The other sample was analyzed for $\text{ClO}_3^-$ by adding $\text{FeSO}_4$ solution and back-titrating excess iron(II) with permanganate solution. Solid phase compositions not reported.	<b>SOURCE AND PURITY OF MATERIALS:</b> The purity of chlorates used was 99.9 % or better.  <b>ESTIMATED ERROR:</b> Soly: accuracy of $y_1 \pm 0.01$ (authors). Temp: precision $\pm 0.1 \text{ K}$ (authors).  <b>REFERENCES:</b>

<sup>a</sup> The mole fraction of potassium chlorate based on moles $KClO_3$ and $Ca(ClO_3)_2$ . <sup>b</sup> In mol kg <sup>-1</sup> units, the authors report the solubility of $KClO_3$ in terms of the following smoothing equation. $\log m_1 = -0.157 - 0.778 \log y_1 - 0.302 (1-y_1)$				
<b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubility was measured by the method of isothermal relief of supersaturation. Equilibrium was reached in 6-8 hours. The apparatus for the solubility determination is shown in figure below.		<b>SOURCE AND PURITY OF MATERIALS:</b> "Analytical reagent" grade calcium chlorate and potassium chlorate were used.		
		<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.05$ K (authors).		
		Samples of satd sln to be analyzed were placed in container 1 which had been previously weighed together with the filter stick. Sodium tetraphenylborate solution was added dropwise over a period of 30 min. The precipitate was allowed to settle, and the mother-liquor withdrawn through the filter stick and transferred into beaker 4 through the fine polyvinyl chloride tube 3. The precipitate was washed twice with 0.06 % aqueous sodium tetraphenylborate, then four or five times with a few millilitres of distilled water. The container with the precipitate and filter stick was dried for 1.5 hours at 105°C, cooled and weighed. The calcium content of the solution in beaker 4 was determined by titration with Trilon B.

<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b>				<b>SOURCE AND PURITY OF MATERIALS:</b>		
Small bottles containing the aqueous alcohol and a large excess of powdered salt were placed in an Ostwald thermostat for about half a day at a temperature some ten degrees higher than that at which the solubility was to be determined. During this time, the bottles were shaken frequently and thoroughly. The temperature was lowered and maintained at the desired value for about a day. The solubility was very nearly constant at the end of 3 days, but at least six days were required for many solutions. About 5 cm <sup>3</sup> of the saturated solution were withdrawn using a pipet and weighed. The solution was evaporated to dryness and weighed.				Potassium chlorate was recrystallized two or three times and dried in an air bath. Ethanol was distilled from lime, stored over dehydrated copper sulfate for one or two days, and finally distilled.		
				<b>ESTIMATED ERROR:</b>		
				Soly: accuracy 0.1 % (author). Temp: nothing specified.

<p>VARIABLES:</p> <p>T/K = 298</p>	<p>PREPARED BY:</p> <p>Hiroshi Miyamoto and Mark Salomon</p>
<p>EXPERIMENTAL VALUES:</p> <p>The solubility of <math>KClO_3</math> in liquid ammonia at 25°C was reported as</p> <p style="text-align: center;">2.52 g/100 g <math>NH_3</math></p> <p style="text-align: center;">0.206 mol <math>kg^{-1}</math> (compilers)</p>	
<p>AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Two methods were used as described in (1).</p> <p><u>Method I.</u> 25 ml test tubes with a constriction at the middle were employed. About 10-25 g <math>NH_3</math> were condensed in the bottom, and the dry salt contained in a small tube tightly covered with cotton cloth was added to the test tube; this small tube remained in the upper part of the test tube as it could not pass the constriction in the middle of the test tube. The top of the test tube was drawn to a tip and sealed, and the tube inverted and placed in a thermostat at 25°C. Equilibrium between <math>NH_3</math> and the excess salt in the small covered tube required 1-3 weeks with periodic shaking. The test tube was then inverted and only the saturated solution drained into the lower end (excess solid remained in the small tube covered with the cotton cloth). The solution was frozen and sealed at the constriction, and weighed. The seal was then broken and the <math>NH_3</math> boiled off, and the residue weighed.</p> <p><u>Method II.</u> Excess <math>NH_3</math> was condensed on a weighed amount of salt in a tube fitted with a stopcock. After thermostating at 25°C, <math>NH_3</math> was slowly permitted to escape through the stopcock until a crystal of solid appeared and remained undissolved upon prolonged shaking.</p> <p>Authors state that the error due to the condensation of gaseous <math>NH_3</math> was not significant since the dead space was kept to a minimum of about 30 <math>cm^3</math>. However this amount of dead space was stated to limit the precision of the method to 0.5 %.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>Reagent grade <math>KClO_3</math> was recrystallized three times from water and then from "a suitable" anhydrous solvent. The salt was dried to constant weight in a vacuum oven.</p> <p>Purification of <math>NH_3</math> not specified, but probably similar to that described in (1). In (1) commercial anhydrous ammonia was stored over metallic sodium for several weeks before use.</p> <p>ESTIMATED ERROR:</p> <p>Soly: accuracy probably around <math>\pm 1-2</math> % (compilers).</p> <p>Temp: 25.00 + 0.025°C: accuracy established by NBS calibration (see ref (1)).</p> <p>REFERENCES:</p> <p>1. August 1984

**CRITICAL EVALUATION:****THE BINARY SYSTEM**

Solubility data in the binary  $\text{RbClO}_3 - \text{H}_2\text{O}$  system have been reported in seven publications (1-7). Three publications (1,2,4) report data only for the binary system whereas the remaining publications (3, 5-7) concern isothermal studies on ternary systems which include data for the binary system.

Although some investigators (1-4) did not report the nature of the solid phase, the evaluators assume it to be the anhydrous salt by analogy to the results found in the studies on ternary systems (see below).

A number of different analytical techniques were used to measure the solubilities. In (1-3) the total salt content was determined gravimetrically, and in (5-6) the chlorate content was determined by back titration of iron (II) sulfate with potassium permanganate. In (6) the rubidium content was also determined gravimetrically with sodium tetraphenylborate and by flame photometry. In (7) the chlorate content was determined by argentimetric titration with silver nitrate after reduction of chlorate to chloride.

The experimental solubility data for the binary system are summarized in Table 1 where the evaluators have made appropriate conversions to both  $\text{mol kg}^{-1}$  and mole fraction units ( $\chi$ ).

**Table 1** Experimental solubility data for  $\text{RbClO}_3$  in water.<sup>a</sup>

303.2	0.474	0.008467	(1)				

<sup>a</sup> All data were converted by the evaluators to molality or mole fraction based on original experimental data reported in refs (1-7).

In evaluating the solubility data in Table 1, we used the two smoothing equations based on mole fractions (see the PREFACE, this volume),

$$Y_x = A/(T/K) + B \ln(T/K) + C + D(T/K) \quad [1]$$

and based on molality (see the INTRODUCTION TO THE SOLUBILITY OF SOLIDS IN LIQUIDS and the PREFACE in Volume 13):

$$Y_m = A/(T/K) + B \ln(T/K) + C \quad [2]$$

where

$$Y_m = \ln(m/m_0) - nM_2(m - m_0) \quad [3]$$

<b>COMPONENTS:</b> (1) Rubidium chlorate; $\text{RbClO}_3$ ; [13446-71-4] (2) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>EVALUATOR:</b> H. Miyamoto Chemistry Department Niigata University, Niigata, Japan and M. Salomon US Army ET & DL Fort Monmouth, NJ USA August, 1984
---	---

**CRITICAL EVALUATION:**

In eq. [3],  $m$  is the molality,  $m_0$  is a reference molality (the 298.2 K value was used for the present analyses),  $n$  is the hydration number in the solid phase ( $n = 0$  for the present system), and  $M_2$  is the molar mass of the solvent. Additional details on eqs. [2-3] can be found in the PREFACE to volume 13 of the Solubility Data Series (1). By giving all data equal weights, we found that three data points from Table 1 could be rejected on the basis that their differences in the experimental and calculated mole fraction solubilities exceeded  $2\sigma_x$  ( $\sigma_x$  is the standard error of estimate as defined in eq. [3] of the  $\text{LiClO}_3\text{-H}_2\text{O}$  critical evaluation). The three data points rejected are from (2) for 293.2 K, from (6) at 298.2 K, and from (1) at 273.2 K. Fitting the remaining 24 data points to eqs. [1] and [2] above resulted in the following:

$$Y_x = -27167.445/(T/K) - 111.3525\ell n(T/K) + 673.495 + 0.145962(T/K) \quad [4]$$

$$\sigma_y = 0.033$$

$$\sigma_x = 0.00014$$

and

$$Y_m = -5904.5/(T/K) - 7.8407\ell n(T/K) + 64.466 \quad [5]$$

$$\sigma_y = 0.015$$

$$\sigma_m = 0.029$$

The solubilities calculated from eqs. [4] and [5] are designated as *recommended solubilities*, and values at rounded temperatures are given in Table 2 below.

Table 2. Recommended solubilities in the binary system calculated from the smoothing equations [4] and [5]

<b>CRITICAL EVALUATION:</b>  <p style="text-align: center;">TERNARY SYSTEMS</p> <p>Data for the solubilities in ternary systems have been reported in 4 publications (3,5-7). A summary of these studies is given in Table 3.</p> <p style="text-align: center;"><u>Table 3.</u> Summary of solubility studies in ternary systems</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">System</th> <th style="text-align: center;">T/K</th> <th style="text-align: center;">Solid Phase</th> <th style="text-align: center;">Reference</th> </tr> </thead> <tbody> <tr> <td><math>\text{RbClO}_3 - \text{CsClO}_3 - \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td style="text-align: center;">Not given</td> <td style="text-align: center;">3</td> </tr> <tr> <td><math>\text{RbClO}_3 - \text{KClO}_3 - \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td style="text-align: center;"><math>\text{RbClO}_3</math>; <math>\text{KClO}_3</math></td> <td style="text-align: center;">3</td> </tr> <tr> <td><math>\text{RbClO}_3 - \text{RbCl} - \text{H}_2\text{O}</math></td> <td style="text-align: center;">273, 298, 323</td> <td style="text-align: center;"><math>\text{RbClO}_3</math>; <math>\text{RbCl}</math></td> <td style="text-align: center;">5</td> </tr> <tr> <td><math>\text{RbClO}_3 - \text{NaClO}_3 - \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td style="text-align: center;"><math>\text{RbClO}_3</math>; <math>\text{NaClO}_3</math></td> <td style="text-align: center;">6</td> </tr> <tr> <td><math>\text{RbClO}_3 - \text{RbNO}_3 - \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td style="text-align: center;"><math>\text{RbClO}_3</math>; <math>\text{RbNO}_3</math></td> <td style="text-align: center;">7</td> </tr> </tbody> </table> <p style="text-align: center;">Solid solution</p> <p>The phase diagrams of the ternary systems, <math>\text{RbClO}_3\text{-RbCl-H}_2\text{O}</math>(5) and <math>\text{RbClO}_3\text{-NaClO}_3\text{-H}_2\text{O}</math> (6) are simple eutonic types, and no double salts are formed. Although the diagrams of the ternary <math>\text{RbClO}_3\text{-CsClO}_3\text{-H}_2\text{O}</math>(3) and <math>\text{RbClO}_3\text{-KClO}_3\text{-H}_2\text{O}</math>(3) were not reported by Kirgintsev, Kashina, Vulikh and Korotkevich in the original paper, the authors reported that rubidium and cesium chlorate form a continuous series of solid solutions, but potassium and rubidium chlorate do not form solid solutions. The solubility in the ternary <math>\text{RbClO}_3\text{-RbNO}_3\text{-H}_2\text{O}</math> system was studied by Shklovskaya, Arkhipov, Kuzina and Tsibulevskaya (7). The crystallization branch of rubidium nitrate and the solid solution based on rubidium chlorate were determined. In the lower concentration range of rubidium nitrate, a solid solution with rubidium chlorate was formed, and the distribution coefficient (see compilation sheet) of rubidium nitrate in the range of crystallization of solid solution is constant.</p> <p style="text-align: center;">OTHER MULTICOMPONENT SYSTEMS</p> <p>The solubility data for the <math>\text{RbClO}_3\text{-RbCl-NaClO}_3\text{-NaCl-H}_2\text{O}</math> system was reported by Arkhipov, Kashina and Kuzina (6). They found four crystallization regions in the system. Two ternary points were obtained corresponding to solutions saturated with: (1) <math>\text{NaCl+NaClO}_3\text{+RbClO}_3</math>; (2) <math>\text{NaCl+RbCl+RbClO}_3</math> (see compilation sheet). Solubilities in the <math>\text{RbClO}_3\text{-RbCl-KClO}_3\text{-KCl-H}_2\text{O}</math> system were studied by Arkhipov, Kashina and Kuzina (8). They found three crystallization fields in the systems: <math>\text{KClO}_3</math>, <math>\text{RbClO}_3</math> and solid solutions of potassium and rubidium chlorides. The main part of the diagram is occupied by the crystallization field of rubidium chlorate (77%) followed by the field of potassium chlorate (20%), and of the solid solutions of potassium and rubidium chlorides (3%).</p> <p>The <math>\text{RbClO}_3\text{-RbCl-CsClO}_3\text{-CsCl-H}_2\text{O}</math> system was also studied by Arkhipov, Kashina and Kuzina (9). Three crystallization regions were defined in the system: the field of <math>\text{CsClO}_3\text{-RbClO}_3</math> continuous solid solutions which occupies 99 % of entire area of the diagram, and the fields of <math>\text{Cs(Rb)Cl}</math> and <math>\text{Rb(Cs)Cl}</math> solid solutions.</p>		System	T/K	Solid Phase	Reference	$\text{RbClO}_3 - \text{CsClO}_3 - \text{H}_2\text{O}$	298	Not given	3	$\text{RbClO}_3 - \text{KClO}_3 - \text{H}_2\text{O}$	298	$\text{RbClO}_3$ ; $\text{KClO}_3$	3	$\text{RbClO}_3 - \text{RbCl} - \text{H}_2\text{O}$	273, 298, 323	$\text{RbClO}_3$ ; $\text{RbCl}$	5	$\text{RbClO}_3 - \text{NaClO}_3 - \text{H}_2\text{O}$	298	$\text{RbClO}_3$ ; $\text{NaClO}_3$	6	$\text{RbClO}_3 - \text{RbNO}_3 - \text{H}_2\text{O}$	298	$\text{RbClO}_3$ ; $\text{RbNO}_3$	7

<b>AUXILIARY INFORMATION</b>																														
<b>METHOD/APPARATUS/PROCEDURE:</b> Method of equilibration not specified, but probably the isothermal method was employed. Aliquots of saturated solution for analysis were withdrawn with a pipet. The aliquots were placed in platinum dishes and the water evaporated. The residues were dried at 120°C to constant weight.	<b>SOURCE AND PURITY OF MATERIALS:</b> Rubidium chlorate was prepared by treating rubidium sulfate with barium chlorate. The product was repeatedly recrystallized until no trace of sulfate and barium were detected. The purity of the salt was checked by volumetrically determining chlorine in the anhydrous chloride dried at 150-160°C.																													
	<b>ESTIMATED ERROR:</b> Not possible to estimate due to insufficient data.

<b>AUXILIARY INFORMATION</b>																																																								
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, soly detd in apparatus shown in figure. At equilibrium, the apparatus was tilted to allow satd sln to filter through connecting tube into weighed test tubes. The test tube was closed with a stopper, withdrawn, and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary soly vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat. Saturated solutions analyzed for chlorate by addition of excess ammonium iron(II) sulfate and back-titration of the excess Fe(II) with potassium permanganate.	<b>SOURCE AND PURITY OF MATERIALS:</b> Results of analysis of $\text{RbClO}_3$ ; Content of $\text{RbClO}_3$ 100.2 %. Impurities, %, K <0.05 %; Cs 0.05; Na <0.05.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.

AUXILIARY INFORMATION						
COMMENTS AND/OR ADDITIONAL DATA:						
The distribution coefficients of rubidium nitrate in the chlorate in the range of crystallization of the solid solution were calculated from the equation						
$D_{\text{RbNO}_3/\text{RbClO}_3} = (x_1/y_1) (1 - y_1/(1-x_1))$						
where $x_1$ is the mole fraction of rubidium nitrate in the solid phase, and $y_1$ the mole fraction of this component in the liquid phase. The results are given in the above table.

<sup>a</sup> $y_1$ = mole fraction of $\text{RbClO}_3$ in mixture of chlorates.																																																																													
<sup>b</sup> calculated by the compiler.																																																																													
<sup>c</sup> For the binary systems at 25°C the compiler computes the following: soly $\text{RbClO}_3$ = 0.394 mol $\text{kg}^{-1}$ and 0.705 mol % soly $\text{CsClO}_3$ = 0.360 mol $\text{kg}^{-1}$ and 0.645 mol %.																																																																													
<b>AUXILIARY INFORMATION</b>																																																																													
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubility in this system was studied by the isothermal relief of supersaturation method. Weighed amounts of chlorates were dissolved in water in 50 $\text{cm}^3$ test-tubes by heating on a water bath at 65-70°C; the test-tubes were then placed in a thermostat at 25°C for 20 min. Supersaturation was then removed by stirring at 60 rpm for 10 h. After settling two samples of liquid phase were removed for analysis. The first was evaporated in a drying cupboard at 70-80°C and then dried to constant weight at 105°C. The other sample was analyzed for $\text{ClO}_3^-$ by adding $\text{FeSO}_4$ soln and back-titrating excess iron(II) with permanganate solution.	<b>SOURCE AND PURITY OF MATERIALS:</b> The purity of chlorates used was 99.9 % or better.  <b>ESTIMATED ERROR:</b> Soly: accuracy of $y_1 \pm 0.01$ (authors). Temp: precision $\pm 0.1$ K (authors).

<b>EXPERIMENTAL VALUES:</b>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> The method of the solubility measurement was similar to that described in ref 1. The isothermal method was used. Equilibrium was reached in 30 hours. Samples of the solid and liquid phases were analyzed. Rubidium and cesium content were determined by flame photometry. Chlorate was determined by adding an excess of iron(II) sulfate to a solution of the specimen and back-titrating with potassium permanganate. The densities of the saturated solutions were also measured.	<b>SOURCE AND PURITY OF MATERIALS:</b> "Chemically pure" grade salts with 99.8% or more purity were used.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b> 1. <b>CRITICAL EVALUATION:</b> THE BINARY SYSTEM																																																																																					
<p>Data for the solubility of CsClO<sub>3</sub> in water have been reported in 6 publications (1-6). The publications (1,4) report solubilities as a function of temperature (273-373 K), Treadwell and Ammann (2) report the solubility at 293.2 K, and in (3, 5, 6) solubilities in ternary systems are reported for 298.2 K. In (3 and 6), the detailed phase studies showed that at 298.2 K, the solid phase in the binary system is the anhydrous salt. Although no other study reports the nature of the solid phase over the experimental temperature range of 273-373 K, the evaluators assume it to be the anhydrous salt since when the solubility is plotted as a function of temperature, all data lie on a smooth monotonic curve indicating a single solid phase. Except for three rejected data points (see below), all data could be easily fitted to a single smoothing equation again indicating a single solid phase.</p> <p>Table 1 summarizes the solubility data for CsClO<sub>3</sub> in water as a function of temperature. With the exception of Treadwell and Ammann's (2) use of mol kg<sup>-1</sup> units, all other original data were reported in mass units. In Table 1 the evaluators have converted from the original units to mole fraction units, and both the original units as well as conversions to mol kg<sup>-1</sup> units can be found in the compilations.</p>

--	--

## CRITICAL EVALUATION:

The 23 acceptable data points were also fitted to the smoothing equation based on mol kg<sup>-1</sup> units, and the resulting equation is:

$$Y_m = -5780.517/(T/K) - 7.1403 \ln(T/K) + 59.864 \quad [2]$$

$$\sigma_y = 0.013$$

$$\sigma_m = 0.008$$

The solubilities calculated from the two smoothing equations are designated as *recommended* solubilities, and values at rounded temperatures are given in Table 2.

## TERNARY SYSTEMS

Data for solubilities in ternary systems have been reported in 3 publications (3, 5, 6). A summary of these studies is given in Table 3. Two ternary systems CsClO<sub>3</sub>-KClO<sub>3</sub>-H<sub>2</sub>O and CsClO<sub>3</sub>-RbClO<sub>3</sub>-H<sub>2</sub>O were studied by Kirgintsev, Kashina, Vulikh and Korotkevich (3). Solid solutions were not formed in the former system, but in the latter, rubidium and cesium chlorate form a continuous series of solid solutions.

Kirgintsev and Kizitskii (5) studied solubilities in the CsClO<sub>3</sub>-Ca(ClO<sub>3</sub>)<sub>2</sub>-H<sub>2</sub>O system at 298 K, but did not study the system at high concentrations of calcium chlorate owing to high solution viscosity. Compositions of the solid phases were not reported.

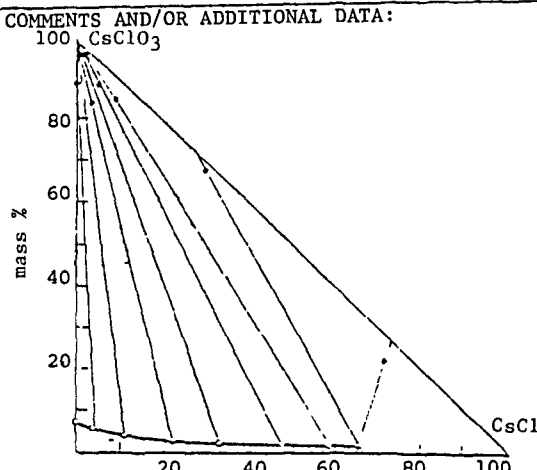

Two ternary systems CsClO<sub>3</sub>-CsCl-H<sub>2</sub>O and CsClO<sub>3</sub>-NaClO<sub>3</sub>-H<sub>2</sub>O were studied by Arkhipov and Kashina (6) using the isothermal method. The solid phases were CsCl and CsClO<sub>3</sub> in the former system, and CsClO<sub>3</sub> and NaClO<sub>3</sub> in the latter. Neither double salts nor solid solutions were reported.

<b>AUXILIARY INFORMATION</b>																														
<b>METHOD/APPARATUS/PROCEDURE:</b> Method of equilibration not specified, but probably the isothermal method was employed. Aliquots of saturated solution for analysis were withdrawn with a pipet. The aliquots were placed in platinum dishes and the water evaporated. The residues were dried at 120°C to constant weight.	<b>SOURCE AND PURITY OF MATERIALS:</b> Cesium chlorate was prepared by treating cesium sulfate with barium chlorate. The product was repeatedly recrystallized until no trace of sulfate and barium were detected. The purity of the salt obtained was checked by volumetrically determining chlorine in the anhydrous chloride dried at 150-160°C. The result was not given.																													
<b>ESTIMATED ERROR:</b> Not possible to estimate due to insufficient data.

<b>AUXILIARY INFORMATION</b>																																																							
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, soly detd in apparatus shown in figure. At equilibrium, the apparatus was tilted to allow satd sln to filter through connecting tube into weighed test tubes. The test tube was closed with a stopper, withdrawn, and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary soly vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat. Satd slns analyzed for chlorate by addition of excess ammonium iron (II) sulfate and back-titration of the excess Fe(II) with potassium permanganate.	<b>SOURCE AND PURITY OF MATERIALS:</b> Results of analysis of CsClO <sub>3</sub> ; Content of CsClO <sub>3</sub> 100.0 % Impurities, %, K <0.05 %; Rb <0.25; Na <0.05.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. <b>AUXILIARY INFORMATION</b>																																																																	
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubilities were determined by the isothermal method by mixing solid and liquid phases in glass test-tubes in a water thermostat. Specimens of the liquid and solid phases were analyzed for the anions and cesium. Chloride was titrated with silver nitrate solution using potassium chromate as an indicator. Chlorate ion concentration was determined volumetrically by adding an excess of iron(II) sulfate solution and titrating the excess Fe(II) with potassium permanganate solution. Cesium was determined gravimetrically as cesium tetraphenylborate. The solid phases were identified by the method of residues, and by X-ray diffraction.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade CsClO <sub>3</sub> and CsCl with a purity of 99.9 % or more were used.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K.  <b>COMMENTS AND/OR ADDITIONAL DATA:</b>

CRITICAL EVALUATION: THE BINARY SYSTEM							
<p>Data for the solubility of LiBrO<sub>3</sub> in water has been reported in four publications (1-4). Mylius and Funk (1) reported the solubility at 291 K, but a typographical error appears to exist: i.e., they reported the solubility as 60.4 mass % or 153.7 g/100g H<sub>2</sub>O, the latter being equivalent to 60.58 mass % (evaluators). While it would appear that the original experimental quantity is the 60.4 mass % value, both values are still too low for 291 K, and were therefore rejected (see below).</p> <p>Simmons and Waldeck (2) reported solubilities over the temperature range of 278-373 K, and Averko-Antonovich (3) reported results over the wide temperature range of 228-416 K. Chemical analyses of the solid phases showed that above 323 K the solid phase is the anhydrous salt, and below 323 K the solid phase is the monohydrate LiBrO<sub>3</sub>.H<sub>2</sub>O [55698-66-3]. The existence of the monohydrate as the solid phase in the binary system was confirmed by Campbell et al. (4) who studied ternary systems, and using the Schreinemakers' method of wet residues found the monohydrate at 298.2 K.</p> <p>A summary of the experimental solubilities are given in Table 1. In this table, the evaluators converted the original mass % units to mole fraction units, and the original units and conversions to mol kg<sup>-1</sup> units can be found in the compilations.</p>

$Y_x = A/(T/K) + B \ln(T/K) + C + D(T/K)$							[1]

<p>COMPONENTS:</p> <p>(1) Lithium Bromate; <math>\text{LiBrO}_3</math>; [13550-28-2]</p> <p>(2) Water; <math>\text{H}_2\text{O}</math>; [7732-18-5]</p>	<p>EVALUATOR:  H. Miyamoto  Niigata University  Niigata, Japan  and  M. Salomon  US Army ET &amp; DL  Fort Monmouth, NJ, USA</p> <p style="text-align: right;">September, 1984</p>
<p>CRITICAL EVALUATION:</p> <p>The complex function <math>Y_x</math> in eq. [1] has been defined previously in the PREFACE and in previous critical evaluations (e.g. see the critical evaluation for the binary <math>\text{LiClO}_3\text{-H}_2\text{O}</math> system). In applying eq. [1] to the mole fraction solubilities in Table 1, we examined each polytherm individually. For each polytherm, all data were initially fitted to eq. [1] and data points rejected when the difference between the experimental and calculated solubilities exceeded two times the standard error of estimate (i.e. for <math>X_{\text{exptl}} - X_{\text{calcd}} &gt; 2\sigma_x</math>). Based on the final tentative and recommended solubilities, the evaluators plotted small portions of the phase diagram in the regions of phase transitions, and our results for the transition temperatures are given below.</p> <p><u>Polytherm for Ice as the Solid Phase.</u> The only data reported for this region of the phase diagram are those of Averko-Antonovich (3). Analyses by fitting these data to eq. [1] showed that all data were acceptable. The smoothing equation for these data is:</p> $Y_x = -63264.50/(T/K) - 510.3943\ln(T/K) + 2812.7729 + 1.032927(T/K) \quad [2]$ $\sigma_y = 0.0025 \quad \sigma_x = 0.0013$ <p>The smoothed solubilities calculated from eq. [2] are designated as <i>tentative</i>, and values at rounded temperatures are given in Table 2.</p> <p><u>Polytherm for <math>\text{LiBrO}_3\cdot\text{H}_2\text{O}</math> as the Solid Phase.</u> All data from references (1-4) were fitted to eq. [1], and only the data of Mylius and Funk (1) had to be rejected. The source of the error in this study cannot be ascertained, but the authors did state that the solid phase was the anhydrous salt. The error in identification of the solid phase and in the low values of the solubility at 291 K indicates a systematic error. The smoothed solubilities based on the data from references (2-4) are designated as <i>recommended</i> solubilities, and values at rounded temperatures are given in Table 2. The smoothing equation is given in eq. [3].</p> $Y_x = -6721.204/(T/K) - 53.5559\ln(T/K) + 293.2835 + 0.113089(T/K) \quad [3]$ $\sigma_y = 0.0071 \quad \sigma_x = 0.0011$ <p>The data of Averko-Antonovich (3) indicates a transition from ice as the solid phase to the monohydrate at around 228 K. The evaluators' graphical analysis of the solubility data in this region show this transition to occur at 230.0 K at a mole fraction solubility of <math>\chi = 0.1408</math>.</p> <p><u>Polytherm for <math>\text{LiBrO}_3</math> as the Solid Phase.</u> The only solubility data for which the solid phase is the anhydrous salt was reported in (2 and 3). Two data points at 318.2 K and 384.2 K from (3) had to be rejected, but the remaining 14 data points could be fitted to the smoothing equation with the following results:</p> $Y_x = -4827.171/(T/K) - 31.1588\ln(T/K) + 174.786 + 0.056935(T/K) \quad [4]$ $\sigma_y = 0.011 \quad \sigma_x = 0.0021$ <p>The smoothed solubilities calculated from eq. [4] are designated as <i>recommended</i> values and are given in Table 2.</p> <p>Both Simmons and Waldeck (2) and Averko-Antonovich (3) found the temperature for the <math>\text{LiBrO}_3\cdot\text{H}_2\text{O} \longrightarrow \text{LiBrO}_3</math> transition to be 325 K, and the evaluators find this transition to occur at 325.3 K at a solubility of <math>\chi = 0.2587</math>.</p> <p>Simmons and Waldeck attempted to measure the melting point of anhydrous <math>\text{LiBrO}_3</math>, and although some decomposition was observed, an "average" value of 521 K was reported. Graphical extrapolation (2) yielded a melting point of 533 K, and eq. [4] predicts a value of 502.8 K.</p>

<b>AUXILIARY INFORMATION</b>																																													
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method used. Water and excess salt were placed in small Pyrex glass-stoppered tubes and agitated until equilibrium was reached (about 3 h). Equilibrium was approached from below because of the tendency to form supersaturated solutions when approaching saturation from above. Samples from 0.5 to 1.5 cm <sup>3</sup> were drawn off by means of pipets into 15 cm <sup>3</sup> weighing bottles. Duplicate samples were evaporated to dryness, and the residues heated to constant mass at 110°C.	<b>SOURCE AND PURITY OF MATERIALS:</b> Lithium bromate was prepared by mixing solutions of lithium sulfate and barium bromate by titrating one solution against the other until a drop of either gave no precipitate. The filtrate from the barium sulfate was concentrated, and upon cooling lithium bromate crystallized out. Duplicate iodometric analyses of the dried salt gave results of 99.50 % and 100 % lithium bromate.																																												
Iodometric analyses of the solid phase at "room temperature" showed the solid phase to be the monohydrate. Analyses of the solid phase at 55°C showed it to be the anhydrous salt.	<b>ESTIMATED ERROR:</b> Soly: authors state experimental inaccuracies are negligible. Compilers estimate a precision of ± 0.1 mass % units. Temp: precision ± 0.02 K to ± 0.1K

AUXILIARY INFORMATION					
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:		
<p>Solubilities above <math>0^\circ\text{C}</math> were studied isothermally. Aliquots of satd sln were withdrawn with a pipet and <math>\text{LiBrO}_3</math> detd iodometrically. The satd sln in equilibrium with metastable salt was prepd as follows: the sln satd at <math>52^\circ\text{C}</math> or above was slowly cooled, stirred for 3-5 h at <math>45^\circ\text{C}</math>, and then allowed to settle for 4 h at <math>45^\circ\text{C}</math>.</p> <p>A satd sln at the boiling point (<math>143^\circ\text{C}</math>) was prepd by gently heating an unsaturated sln at about <math>143^\circ\text{C}</math>, and excess salt was added to the sln. The resulting satd sln was allowed to settle at the boiling point, and clear sln was withdrawn into a capillary glass tube and allowed to solidify. The tube was cut into three pieces, weighed, and the <math>\text{LiBrO}_3</math> content detd iodometrically.</p> <p>Below <math>0^\circ\text{C}</math> a mixture of <math>\text{LiBrO}_3</math> and water was placed in a tube equipped with a stirrer, and the tube cooled in a Dewar flask (acetone and solid <math>\text{CO}_2</math>). The satd sln was allowed to settle for a few hours, and aliquots withdrawn with a glass tube equipped with a glass-wool or asbestos filter. A water jet-pump was used to filter off the sln, and the slns were analyzed iodometrically. (contd)</p>			No information given.

<b>AUXILIARY INFORMATION</b>																
<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions were prepared in an Erlenmeyer flask by mixing the dried acetone with an excess of halate for two hours. The solution was constantly stirred by bubbling dry air (air was dried by passing it through $\text{CaCl}_2$ while pumping it into the solution). Air going out from the flask after bubbling in the solution carried some acetone vapor during this operation. The solution temperature was kept constant by immersing the flask in a constant temperature water bath. After two hours, the air exit was closed. The resulting pressure forced the saturated solution from the Erlenmeyer through a tube filled with cotton which acted as a filter, and was collected in a small flask. This flask was stoppered and weighed. The halate contained in the sample was weighed after complete evaporation of acetone. In all cases, weights were reported to the fourth decimal figure.	<b>SOURCE AND PURITY OF MATERIALS:</b> Commercial redistilled acetone. This acetone was then dehydrated three times by leaving it in contact with calcium chloride for forty eight hours each time. Fresh $\text{CaCl}_2$ was used in each operation. Finally, the dehydrated acetone was distilled at 56.3°C. Source and purity of $\text{LiBrO}_3$ not specified.															
<b>ESTIMATED ERROR:</b> Nothing specified.

## CRITICAL EVALUATION:

## THE BINARY SYSTEM

The evaluators have examined seven publications (1-7) which report the solubility of NaBrO<sub>3</sub> in water. Linke and Seidell (8) cite three publications by Kremers (9), but the evaluators were unable to obtain copies of Kremers' papers. Upon detailed comparisons (see below), the solubilities reported by Kremers are all too large and were rejected.

A summary of the experimental solubilities is given in Table 1. In all cases the equilibrated solid phase is the anhydrous salt. It is noted that Linke and Seidell incorrectly attribute the experimental solubility at 373 K to Ricci (1) when in fact Ricci did not report any solubilities above 325 K, and the 373 K result must be from (9). Solubilities in mole kg<sup>-1</sup> and mole dm<sup>-3</sup> units are given in the compilations.

Table 1. Summary of Experimental Solubilities<sup>a</sup>

<sup>a</sup>Original units are mass %. Mole fractions calculated by evaluators.

<sup>b</sup>Rejected data points. See text for discussion.

<sup>c</sup>Result obtained by graphical extrapolation.

<sup>d</sup>Results quoted from Ref. (8).

It is important to note that there are a number of entries in Table 1 from references (1-3, 5, 6) which are identical, and since the authors do not indicate that these identical solubilities are the result of the original study (1), the evaluators assume that these are all independent measurements which must be given equal weights. This is not a trivial point since by making the assumption that all data reported in (1-3, 5, 6) represent independent measurements, it is obvious that these data have greater weight in our least squares analyses (see below), and the consequence is that some data must be rejected. For example, the result at 298.15 K reported by Campbell et al. (7) had to be rejected which is somewhat of a surprise since Campbell's work is generally of high precision.

All solubility data in Table 1 were fitted to the smoothing equation

$$Y_x = A/(T/K) + B \ln(T/K) + C + D(T/K) \quad [1]$$

Data were rejected when the difference in the calculated and experimental solubilities exceeded twice the standard error of estimate.

<p>COMPONENTS:</p> <p>(1) Sodium Bromate; NaBrO<sub>3</sub>; [7789-38-0]</p> <p>(2) Water; H<sub>2</sub>O; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto Niigata University Niigata, Japan and M. Salomon US Army ET &amp; DL Fort Monmouth, NJ, USA</p> <p style="text-align: right;">March, 1984</p>
<p>CRITICAL EVALUATION:</p> <p>Based on the criterion for exceptable data points, two data points from (4) were rejected, the singular data point at 298.15 K from (7) was rejected, and all data from (9) were rejected. Fitting the remaining 22 data points to the smoothing eq. [1] gives the following result for the mole fraction solubilities:</p> $Y_x = -24576.69/(T/K) - 124.4405\ln(T/K) + 735.8949 + 0.1698543(T/K) \quad [2]$ $\sigma_y = 0.0026 \qquad \sigma_x = 7.3 \times 10^{-5}$ <p>The solubilities calculated from this smoothing equation are designated as <i>recommended</i> values, and values at rounded temperatures are given in Table 2. It is interesting to note that we can also obtain a satisfactory fit to eq. [1] by including the melting point of 281 K for NaBrO<sub>3</sub> (10). Thus for 23 data points including the melting point of the solid, the following is obtained:</p> $Y_x = -18558.18/(T/K) - 85.7656\ln(T/K) + 513.8164 - 0.107927(T/K) \quad [3]$ $\sigma_y = 0.0033 \qquad \sigma_x = 8.9 \times 10^{-5}$ <p>For the 22 acceptable data points, the solubilities in mol kg<sup>-1</sup> units were fitted to the following smoothing equation:</p> $Y_m = -3893.57/(T/K) - 8.30776\ln(T/K) + 60.39155(T/K) \quad [4]$ $\sigma_y = 0.0029 \qquad \sigma_m = 0.0089$ <p>The solubilities calculated from this smoothing equation are designated as <i>recommended</i> values, and values at rounded temperatures are given in Table 2.</p> <p>Finally, for those publications which give density data (1, 2, 5, 6), we were able to calculate solubilities in mol dm<sup>-3</sup> units (see the compilations). These solubilities were fitted to the following smoothing equation:</p> $\ln(c/\text{mol dm}^{-3}) = -5813.91/(T/K) - 15.3545\ln(T/K) + 107.8469(T/K) \quad [5]$ $\sigma_c = 0.0070$ <p>Solubilities calculated from eq. [5] are designated as <i>recommended</i> solubilities, and values at rounded temperatures are given in Table 2.</p> <p style="text-align: center;">MULTICOMPONENT SYSTEMS</p> <p>Ternary systems of two saturating components of NaBrO<sub>3</sub> and an alkali metal halide are all of the simple eutonic type (1, 4). The NaBrO<sub>3</sub>-NaBr-H<sub>2</sub>O system was studied by both Ricci (1) and Klebanov and Basova (4), but direct comparisons cannot be made since the temperatures used differ in these studies.</p> <p>The compilations should be consulted for other ternary systems involving sulfates (1, 2), halates (3, 5, 7) or sodium molybdate (6). A number of quaternary systems were reported in (4).</p> <p>Note that the compilations of (3) and (7) can be found in the chapters on NaClO<sub>3</sub> and LiBrO<sub>3</sub>, respectively.</p>

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of NaBrO <sub>3</sub> and water were placed in a bottle, and rotated in a large water thermostat for two days which was found to be sufficient for attainment of equilibrium. Samples of the saturated solution were withdrawn by means of a calibrated pipet provided with a folded filter paper at the tip. The bromate content was determined by titration with standard sodium thiosulfate solution.			<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade NaBrO <sub>3</sub> was recrystallized, dried to the anhydrous state, and then kept constantly in a 100°C oven.		
			<b>ESTIMATED ERROR:</b> Soly: accuracy within 0.2 %. Temp: precision ± 0.01 K. Densities: precision about 0.1 %.

<b>AUXILIARY INFORMATION</b>													
<b>METHOD/APPARATUS/PROCEDURE:</b> Appropriate excess of purified salts were placed in ampoules, and heavy water was distilled in under vacuum and the ampoules sealed. Equilibrium was approached from the high temperature side only by rotating the ampoules for 12 to 48 hours in a water-bath. After settling one hour, 2-5 ml samples of solution were removed with pipets fitted with glass wool filters. The pipets were kept at the same temperature as the solutions. Samples of the solution were transferred to tared 30 ml platinum crucibles contained in suitable weighing bottles, and evaporated to dryness. All solubility determinations were performed in duplicate.	<b>SOURCE AND PURITY OF MATERIALS:</b> Commercial reagent grade salt was recrystallized at least twice. Heavy water was treated by distillation from alkaline permanganate and then from crystals of potassium dichromate or chromic anhydride. The product was found to have a conductivity of $2 \times 10^{-6}$ S cm <sup>-1</sup> or better.												
	<b>ESTIMATED ERROR:</b> Soly: precision 0.5 % or better (author). Temp: precision $\pm 0.01$ K (author).

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Saturated solutions were prepared by stirring complexes of known compositions. Aliquots of saturated solution for analyses were withdrawn with calibrated pipets fitted with filters at the tips. Bromate content in the saturated solutions was determined iodometrically. In the presence of molybdate, a slight excess of aqueous HCl solution was required to obtain the correct end-point within the short titration time. The total salt content of liquid and solid samples was determined by evaporation and drying to constant weight.			<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade sodium molybdate dihydrate was used. The salt was completely dehydrated at 180°C, and stored at 150°C. The purity of this anhydrous salt was found to be 100.0%. C.p. grade sodium bromate used and was found to be pure within 1/1000.		
<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram for this ternary system is given (superimposed) on the phase diagram for the Na <sub>2</sub> MoO <sub>4</sub> -NaIO <sub>3</sub> -H <sub>2</sub> O system (see the compilation for this latter system).			<b>ESTIMATED ERROR:</b> Soly: the accuracy of titration was within 0.1%. Temp: precision ± 0.04 K.

<b>AUXILIARY INFORMATION</b>																																													
<b>METHOD/APPARATUS/PROCEDURE:</b> The isothermal method was used. Prior to the experiment the carbon dioxide content in solution was checked by phenolphthalein. The salt and water were placed into a tube equipped with a stirrer, and the tube placed in a water thermostat. A layer of paraffin placed on the surface of water in the thermostat at 80°C. Equilibrium was reached in a day. The sodium bromate content was determined iodometrically by titration with 0.1 mol dm <sup>-3</sup> thiosulfate solution. The sodium carbonate was titrated with 0.1 mol dm <sup>-3</sup> HCl. The composition of the solid phase was identified by Schreinemakers' method, and by crystal optics.	<b>SOURCE AND PURITY OF MATERIALS:</b> Chemically pure grade sodium carbonate was used without further purification. Sodium bromate was prepared as follows: (1) The salt was synthesized by the following reaction: $\text{Br}_2 + 5\text{Cl}_2 + 12\text{NaOH} = 2\text{NaBrO}_3 + 10\text{NaCl} + 6\text{H}_2\text{O}$ . (2) $\text{KBrO}_3$ was reacted with $\text{BaCl}_2$ . The $\text{Ba}(\text{BrO}_3)_2$ obtained was treated with $\text{Na}_2\text{SO}_4$ . The pptd $\text{BaSO}_4$ was removed by filtration and $\text{NaBrO}_3$ crystallized from the filtrate. The product was recryst to remove foreign ions. <b>ESTIMATED ERROR:</b> Nothing specified. <b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>																																																																																									
<b>METHOD/APPARATUS/PROCEDURE:</b> The ternary complexes were prepared from weighed amounts of water and the two anhydrous salts: these complexes were rotated in a large thermostat for about two days, a time found to be sufficient for attaining equilibrium. Samples of the saturated solution were withdrawn by means of a calibrated pipet provided with a folded filter paper at the tip. The bromate was determined by titration with standard sodium thiosulfate solution, and the total solids by evaporation at 100°C and drying at 250°C. Sodium nitrate was found by difference. For the determination of solid phase compositions, the method of algebraic extrapolation of tie-lines was used.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade salts were recrystallized, dried to the anhydrous state, and kept constantly in a 100°C oven. <table border="1" data-bbox="669 1594 1225 1721" style="width: 100%; border-collapse: collapse;"> <tbody> <tr> <td> <b>ESTIMATED ERROR:</b>                Soly: accuracy within 0.2 %. <b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>			
The ternary complexes were prepared from weighed amounts of water and the two anhydrous salts: these complexes were rotated in a large thermostat for about two days, a time found to be sufficient for attaining equilibrium.			C.p. grade salts were recrystallized, dried to the anhydrous state, and kept constantly in a 100°C oven.			
Samples of saturated solution were withdrawn by means of a calibrated pipet provided with a folded filter paper at the tip. The bromate was determined by titration with standard sodium thiosulfate solution, and the total solids by evaporation at 100°C and drying at 250°C. Sodium chloride was found by difference.						
For the determination of solid phase compositions, the method of algebraic extrapolation of tie-lines was used.			<b>ESTIMATED ERROR:</b>			
			Soly: accuracy within 0.2 %.			
			Temp: precision ± 0.01 K.			
			Densities: precision about 0.1 %.

<b>AUXILIARY INFORMATION</b>																																													
<b>METHOD/APPARATUS/PROCEDURE:</b> The isothermal method was used. Prior to the experiment, the carbon dioxide content in solution was checked by phenolphthalein. The salt and water were placed into a tube equipped with a stirrer. The tube was kept in a water thermostat. Equilibrium was reached in a day. The sodium bromate content was determined iodometrically. The sodium bromide content was determined as follows: sulfurous acid solution was added to the sample solution containing sodium bromate and bromide, and the solution boiled to remove excess SO <sub>2</sub> . Bromide was determined by Volhard's method using standardized silver nitrate solution. The sodium bromide content was calculated by difference. The composition of the solid phase was identified by Schreinemakers' method, and by crystallography.	<b>SOURCE AND PURITY OF MATERIALS:</b> Analytical grade sodium bromide was used. The sodium bromide contained 0.2% NaCl or less. Sodium bromate was prep'd as follows: (1) Barium chloride was added to barium bromate solution, and the resulting solution was treated with sodium sulfate solution. The sodium bromate obtained was recrystallized. (2) The reaction Br <sub>2</sub> + 5Cl <sub>2</sub> + 12NaOH = 2NaBrO <sub>3</sub> + 10NaCl + 6H <sub>2</sub> O was used to prepare the sodium bromate.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b>

AUXILIARY INFORMATION						
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:			
<p>The ternary complexes were prepared by weight, using distilled water, c.p. NaBrO<sub>3</sub> and c.p. AgBrO<sub>3</sub>. Attainment of equilibrium was proved in almost all cases by repeated analysis of the solution after further stirring. The complexes were stirred for periods of 2 or 8 weeks. In the last one or two mixtures at 25°C in above table (next page), AgBrO<sub>3</sub> content was determined gravimetrically as AgBr after reduction with NaNO<sub>2</sub>. NaBrO<sub>3</sub> was determined by evaporation of the solution to dryness.</p>			<p>C.p. AgBrO<sub>3</sub> and c.p. NaBrO<sub>3</sub> were used. The purity of the c.p. NaBrO<sub>3</sub> was found to be (100 ± 0.1%). The purity of the c.p. AgBrO<sub>3</sub> was determined to be 98.2% silver bromate and 1.8% sodium bromate.</p>			
			<p><b>ESTIMATED ERROR:</b> Solubility errors in solubility of AgBrO<sub>3</sub> in water and of NaBrO<sub>3</sub> in water are ±0.004 mass % and ±0.02 mass %, respectively. Temperature: nothing specified.</p>

<sup>a</sup> A = $\text{NaBr}$ ;      B = $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ ;      C = $\text{NaBrO}_3$						
<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Prior to the experiment, the $\text{CO}_2$ content in water was checked with phenolphthalein. The salts and water were placed into a tube equipped with a stirrer, and the tube placed in a water thermostat. A layer of paraffin was placed on the surface of the water in the thermostat at 80°C. Equilibrium was reached in a day. The sodium bromate content was detd iodometrically by titrn with $0.1 \text{ mol dm}^{-3}$ thiosulfate solution. The sodium bromide content was detd as follows: sulfurous acid was added to an aliquot of saturated sln, and the sln boiled to remove excess $\text{SO}_2$ . The bromide was detd by Volhard's method using standard silver nitrate sln, and the sodium bromide content was obtained by difference. The sodium carbonate was detd by titrn with $0.1 \text{ mol dm}^{-3}$ . Solid phase compositions detd by Schreinemakers' method, and by crystal optics.				<b>SOURCE AND PURITY OF MATERIALS:</b> Analytical grade $\text{NaBr}$ was used. The $\text{NaBr}$ contained less than 0.2% $\text{NaCl}$ . Chemically pure grade $\text{Na}_2\text{CO}_3$ was used. Sodium bromate was prepd as follows: (1) The reaction, $\text{Br}_2 + 5\text{Cl}_2 + 12\text{NaOH} = 2\text{NaBrO}_3 + 10\text{NaCl} + 6\text{H}_2\text{O}$ , was used to prepare the sodium bromate. (2) Barium chloride was reacted with $\text{KBrO}_3$ . The $\text{Ba}(\text{BrO}_3)_2$ obtained was treated with $\text{Na}_2\text{SO}_4$ . The pptd $\text{BaSO}_4$ was removed by filtration and $\text{NaBrO}_3$ crystallized from the filtrate. The product was recryst to remove foreign ions.		
				<b>ESTIMATED ERROR:</b> Nothing specified.

<b>COMPONENTS:</b> (1) Sodium Bromate; NaBrO <sub>3</sub> ; [7789-38-0] (2) N-Methylacetamide; C <sub>3</sub> H <sub>7</sub> NO; [79-16-3]	<b>ORIGINAL MEASUREMENTS:</b> Dawson, L.R.; Berger, J.E.; Vaughn, J.W.; Eckstrom, H.C.  <i>J. Phys. Chem.</i> <u>1963</u> , <i>67</i> , 281-3.
<b>VARIABLES:</b> T/K = 313	<b>PREPARED BY:</b> Hiroshi Miyamoto and Mark Salomon
<b>EXPERIMENTAL VALUES:</b>  The solubility of NaBrO <sub>3</sub> in n-methylacetamide, CH <sub>3</sub> CONHCH <sub>3</sub> , at 40°C was given as $0.10 \text{ mol dm}^{-3}$	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> An "approximate" solubility was determined by the conductivity method. About 0.5 to 1.0 gram of salt and 10 ml of solvent were placed in a large test tube, stoppered and covered with aluminum foil, and heated to 60°C. Upon cooling to 40°C, the occurrence of precipitation was assumed to indicate the existence of a saturated solution. Conductivities were measured in duplicate in "the usual manner." Experimental details and the measured electrolytic conductivities were not given.  The concentration of the salt in the saturated solution was determined from the experimental electrolytic conductivities, but details on the calculation were not given. Presumably the limiting law was used as in (1).	<b>SOURCE AND PURITY OF MATERIALS:</b> N-Methylacetamide was prepared by reacting monoethylamine with glacial acetic acid and subsequent heating to distill off the water. The product was purified by fractional distillation followed by five or more fractional freezing cycles. The electrolytic conductance of the purified solvent ranged from $0.5 \times 10^{-5}$ to $2 \times 10^{-5}$ S cm <sup>-1</sup> .  Reagent grade NaBrO <sub>3</sub> was dried in a vacuum desiccator over anhydrous magnesium perchlorate without further treatment.  <b>ESTIMATED ERROR;</b> Soly: authors "believe" the solubility to be accurate to within 5%. Temp: not specified.

<b>VARIABLES:</b> Room temperature (compiler's assumption)	<b>PREPARED BY:</b> Mark Salomon and Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b>  The solubility of NaBrO <sub>3</sub> in hydrazine at room temperature was given as $0.01 \text{ g/ cm}^3 \text{ N}_2\text{H}_4$ The authors stated that the chief object of the research was to obtain qualitative and approximate quantitative data, and the temperature was not kept constant.	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubility vessel has a glass tube to which a U-shaped capillary tube was attached to the bottom. A stopcock at the end of the capillary permitted the adjustment of the rate of flow of dry nitrogen. About 1 cc of anhydrous hydrazine was placed in the tube, and small amounts of NaBrO <sub>3</sub> added from a weighing bottle. After each addition of NaBrO <sub>3</sub> , a loosely fitting cork was placed in the top of the solubility tube. Nitrogen was bubbled through solution until the salt dissolved. The process was repeated until no more salt would dissolve. Temperature was not kept constant.  The accuracy of this method is very poor. In addition, the authors stated that it was difficult to prevent the oxidation of hydrazine.	<b>SOURCE AND PURITY OF MATERIALS:</b> Anhydrous hydrazine was prepared by first partially dehydrating commercial hydrazine with sodium hydroxide according to the method of Raschig (1). Further removal of water by distn from barium oxide after the method of de Bruyn (2). The type of distillation apparatus employed and the procedure followed in the respective distillations were those described by Welsh (3). The product was found on analysis to contain 99.7 % hydrazine. The hydrazine was stored in 50 cm <sup>3</sup> sealed tubes. Sodium bromate was the ordinary pure chemical of standard manufacture.  <b>ESTIMATED ERROR:</b> Soly: accuracy $\pm$ 50 % at best (compilers).  <b>REFERENCES:</b> 1. Raschig, F. <i>Ber. Dtsch. Chem. Ges.</i> <u>1927</u> , 43, 1927.; Hale, C.F.; Shetterly, F.F. <i>J. Am. Chem. Soc.</i> <u>1911</u> , 33, 1071. 2. de Bruyn, L. <i>Trav. Chim. Pays-Bas.</i> <u>1895</u> , 14, 458. 3. Welsh, T.W. <i>J. CRITICAL EVALUATION:							
THE BINARY SYSTEM							
<p>Solubility data for the binary <math>\text{KBrO}_3\text{-H}_2\text{O}</math> system have been reported in 13 publications (1-13). Breusov et al. (13) also cite data from a handbook (14) which the evaluators cannot trace. For those solubility values from (14) which we cannot locate, the majority are much higher than those reported in (1-13), and they must be rejected in any case. Note that the compilation of reference (6) is given in the <math>\text{KClO}_3</math> chapter.</p> <p>No hydrates of <math>\text{KBrO}_3</math> have been reported, and the solid phase in all studies is the anhydrous salt. All studies employed the isothermal method with the exception of the study by Benrath et al. (5) who used the synthetic method over the temperature range of 407-585 K. In analyzing the solubility data, we have treated the low and high temperature data separately: i.e. from the isothermal studies over the temperature range of 273-373 K, and from the synthetic study over the temperature range of 407-585 K. Summaries of these data are given in Tables 1 and 2, respectively.</p>

## CRITICAL EVALUATION:

Solubility data in  $\text{mol dm}^{-3}$  units were reported in (1,2), and while Ricci et al. (3,6) reported data in mass % units, densities for the saturated solutions were also given enabling the evaluators to convert these mass units into volume units. Table 3 lists the solubility data in volume units from 278-313 K.

Table 3. Experimental Solubilities Based on Volume Units<sup>a</sup>

T/K	density/g $\text{cm}^{-3}$	c/mol $\text{dm}^{-3}$	reference
278.15	1.024	0.2233	3
283.15	1.035	0.2795	3
288.15	1.042	0.3367	3
293.15	1.048	0.4054	3
298.15	1.054	0.4754	3,6
298.2	----	0.4715 <sup>b</sup>	1
298.2	----	0.478	2
303.15	1.062	0.5587	3
308.15	1.074	0.6515	3
313.15	1.083	0.7510	3

<sup>a</sup>Original data from (3,6) are in mass %, and conversions to  $\text{mol dm}^{-3}$  calculated by evaluators using experimental densities of saturated solutions given in the table.

<sup>b</sup>Rejected data point.

Over the temperature range of 273-373 K, the mole fraction solubility data were fitted to the smoothing equation, and four data points were rejected on the basis that the difference between calculated and observed solubilities exceeded  $2\sigma_m$  (see Table 1 for rejected data points). The remaining 30 data points were used to obtain the following smoothing equation:

$$Y_x = -22549.21/(T/K) - 83.2220\ln(T/K) + 514.161 + 0.092301(T/K) \quad [1]$$

$$\sigma_y = 0.011 \quad \sigma_x = 6.3 \times 10^{-5}$$

The smoothed solubilities calculated from eq. [1] are designated as *recommended* values, and are given in Table 4.

Over the temperature range of 407-585 K, the data of Benrath et al. (5) were used to obtain the following smoothing equation:

$$Y_x = -45971.8/(T/K) - 169.820\ln(T/K) + 1060.642 + 0.16898(T/K) \quad [2]$$

$$\sigma_y = 0.079 \quad \sigma_x = 0.0086$$

The standard error in the solubilities is quite high, and we designate the calculated (smoothed) solubilities as *tentative* values. Using eq. [2] to calculate solubilities outside the experimental temperature range is not recommended. The melting point of  $\text{KBrO}_3$  calculated from eq. [2] is 660.1 K which is not in good agreement with the hand-book value of 623 K (15): according to (15) the pure salt decomposes at 643 K.

For the solubilities in  $\text{mol kg}^{-1}$  units over the temperature range of 273-373 K, the 30 acceptable data used to derive the smoothing equation [1] were fitted to the following smoothing equation:

$$Y_m = -6137.40/(T/K) - 10.4118\ln(T/K) + 79.904 \quad [3]$$

$$\sigma_y = 0.0070 \quad \sigma_m = 0.0088$$

		Fort Monmouth, NJ, USA	June, 1985

CRITICAL EVALUATION:

The mol kg<sup>-1</sup> solubilities calculated from eq.[3] are designated as *recommended* values, and values at rounded temperatures are given in Table 4.

The solubilities in units of mol dm<sup>-3</sup> were fitted to the simple smoothing equation:

$$\ln(c/\text{mol dm}^{-3}) = -7507.54/(T/K) - 15.3273\ln(T/K) + 111.769 \quad [4]$$

$$\sigma_c = 0.0018$$

We designate the smoothed solubilities as *tentative*, and values from 278-313 K are given in Table 4.

Table 4. Recommended and Tentative Solubilities Calculated from the Smoothing Equations [1], [3], [4]. Solid Phase is the Anhydrous Salt.

TERNARY SYSTEMS

The solubility of KBrO<sub>3</sub> in ternary systems have been reported in a number of publications (3, 4, 6, 8-12), and detailed information can be found in the compilations. Since no two studies are exactly alike, comparisons cannot be made and therefore critical evaluation is not possible at this time.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of $\text{KBrO}_3$ and water were placed in bottles and rotated in a large water thermostat for two days, a time found to be sufficient for attaining equilibrium. Samples of the saturated solution were withdrawn by means of a calibrated pipet provided with a folded filter paper at the tip. The bromate was determined by titration with standard sodium thiosulfate solution.			<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade $\text{KBrO}_3$ was recrystallized, dried to the anhydrous state, and stored in a $100^\circ\text{C}$ oven.		
			<b>ESTIMATED ERROR:</b> Soly: accuracy within 0.2 %. Temp: precision $\pm 0.01$ K. Densities: precision about 0.1 %.

<b>AUXILIARY INFORMATION</b>																																																								
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, the solubility was determined in the apparatus shown in the figure. At equilibrium the apparatus was tilted to allow saturated solution to filter through connecting tube into weighed test tubes. The test tubes were closed with a stopper, withdrawn and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary solubility vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat.  Bromate was determined iodometrically.	<b>SOURCE AND PURITY OF MATERIALS:</b> Results of analysis of $\text{KBrO}_3$ : content of $\text{KBrO}_3$ = 99.3 %, and impurities are Rb (0.1 %), Cs (0.01 %), Na (0.016 %), $\text{SO}_4$ (0.005 %), and Fe (0.0001 %).  The alkali metal impurities were dtd by flame photometry, the iron colorimetrically, and sulfate nephelometrically.  <b>ESTIMATED ERROR:</b> Soly: nothing specified.  Temp: precision $\pm 0.1$ K.  <b>REFERENCES:</b>

<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions of $\text{KBrO}_3$ in the $\text{H}_2\text{O}-\text{D}_2\text{O}$ mixtures were prepared by the method of supersaturation. The supersaturated solutions were prepared by agitating excess salt with the water mixture for one hour at $60^\circ\text{C}$ ; the time of agitation in the $25^\circ\text{C}$ bath was 3 hours. A sample of the clear solution was delivered into a weighing bottle, the solvent evaporated and the residual pure salt was dried in vacuum at $100^\circ\text{C}$ and weighed.	<b>SOURCE AND PURITY OF MATERIALS:</b> Potassium bromate was purified by recrystallization from conductivity water and found to be free from bromide. The salt was dried over calcium chloride in a desiccator for several days before use. $\text{D}_2\text{O}$ content of the water mixture was determined by pycnometer both before and after each measurement. The mole percentage was calculated from the specific gravity at $25^\circ\text{C}$ (ref 1).  <b>ESTIMATED ERROR:</b> Soly: accuracy about 1 % (authors). Temp: precision $\pm 0.03$ K.  <b>REFERENCES:</b> 1. Swift, E. Jr. <i>J. Am. Chem. Soc.</i> <u>1939</u> , 61, 198.

<b>AUXILIARY INFORMATION</b>															
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of aqueous $\text{NaCl}$ solution and solid $\text{KBrO}_3$ were placed in bottles, and the bottles rotated in a thermostat. After equilibrium was established, the saturated solutions were allowed to settle in the thermostat. Samples were withdrawn with a pipet equipped with a cotton-wool filter. The determination of $\text{KBrO}_3$ was rapidly performed by iodometric titration.	<b>SOURCE AND PURITY OF MATERIALS:</b> No information given.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b>

<sup>b</sup> For the binary system the compiler computes the following: soly of $\text{KBrO}_3$ = 0.4878 mol $\text{kg}^{-1}$					
<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> The ternary complexes were prepared from weighed amounts of water and the two anhydrous salts: these complexes were rotated in a large thermostat for about two days, a time found to be sufficient to reach equilibrium. Samples of the saturated solution were withdrawn with a calibrated pipet provided with a folded filter paper at the tip. The bromate was determined by titration with standard sodium thiosulfate solution, and the total solid by evaporation at 100°C and drying at 250°C. Potassium nitrate was found by difference. For the determination of solid phases, the method of algebraic extrapolation of tie-lines was used.			<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade salts were recrystallized, dried to the anhydrous state, and stored in a 100°C oven.		
			<b>ESTIMATED ERROR:</b> Soly: accuracy within 0.2 %. Temp: precision $\pm$ 0.01 K. Densities: precision about 0.1 %.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>		
The isothermal method was used. After complexes of salts and water were vigorously stirred for 1.5 to 2.0 hours, equilibrium was established. The bromate content was determined iodometrically. The bromide content was determined by Volhard's method: the solution containing bromide was treated with excess standard silver nitrate solution and the residual silver nitrate determined by titration with standard ammonium thiocyanate solution.			No information was given.		
The determination of the composition of solid phases was not described in the original paper.			<b>ESTIMATED ERROR:</b>		
			Nothing specified.

<sup>a</sup> A = KI;      B = $\text{KBrO}_3$				
<sup>b</sup> For the binary system the compiler computes the following:  soly of $\text{KBrO}_3$ = 0.4878 mol $\text{kg}^{-1}$ .				
<b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b> The ternary complexes were prepared from weighed amounts of water and the two anhydrous salts: these complexes were rotated in a large thermostat for about two days, a time found to be sufficient to reach equilibrium. Samples of the saturated solution were withdrawn with a calibrated pipet provided with a folded filter paper at the tip. The bromate was determined by titration with standard sodium thiosulfate solution, and the total solid by evaporation at 100°C and drying at 250°C. Potassium iodide was found by difference. For the determination of solid phases, the method of algebraic extrapolation of tie-lines was used.		<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade salts were recrystallized, dried to the anhydrous state, and stored in a 100°C oven.		
		<b>ESTIMATED ERROR:</b> Soly: accuracy within 0.2 %. Temp: precision $\pm$ 0.01 K. Densities: precision about 0.1 %.

<sup>a</sup> $m$ = the total molality of the salts in liquid phase.					
<sup>b</sup> $y_1$ = the mole fraction of $\text{KBrO}_3$ based on total bromate content.					
<sup>c</sup> For the binary systems the compiler computes the following:					
soly of $\text{KBrO}_3$ = 0.488 mol $\text{kg}^{-1}$					
soly of $\text{RbBrO}_3$ = 0.136 mol $\text{kg}^{-1}$					
<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubility was studied by the isothermal relief of supersaturation followed by mixing of the solid phase and mother liquor for 24 hours at 25°C. To verify the solubility of the method used to establish equilibrium, the solubilities for several points were detd by the method of isothermal saturation with mixing for 30 days. The number of moles of the anion ( $n_1$ ) were detd by iodometric titrn. Alkali metal contents were determined in the same samples by flame photometry from three parallel analyses. In each analysis the authors calculated the sum of the moles of the cations ( $n_2$ ). The composition of the solid phase was detd by the Schreinemakers' method of residues. A phase diagram indicating the existence of a hydrate was not given in the original paper. Densities of the saturated solutions at 25°C were determined, but the data were not given.			<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade $\text{KBrO}_3$ and $\text{RbBrO}_3$ were recrystallized from double distilled water.		
			<b>ESTIMATED ERROR:</b>

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Ternary mixtures, $\text{AgBrO}_3\text{-KBrO}_3\text{-H}_2\text{O}$ , of known composition were made to come to equilibrium at 25°C. The mixture was stirred for 2 weeks. The solution was simply evaporated to dryness for its $\text{KBrO}_3$ content since the solubility of $\text{AgBrO}_3$ in the presence of $\text{KBrO}_3$ was found to be negligible. The determination method of $\text{AgBrO}_3$ in solution was not given, but it was probably by Volhard titration with $\text{KSCN}$ since this was the method used for $\text{AgClO}_3\text{-NaClO}_3\text{-H}_2\text{O}$ system reported in the same paper.			<b>SOURCE AND PURITY OF MATERIALS:</b> $\text{AgBrO}_3$ was prepared by adding a dilute sln of bromic acid to $\text{Ag}_2\text{CO}_3$ in the presence of $\text{HNO}_3$ . After some heating and digestion, the solid was washed with water, and finally dried at 110°C. The two batches prepared gave 99.93 and 99.75% $\text{AgBrO}_3$ by Br analysis. $\text{Ag}_2\text{CO}_3$ was made by addition of $\text{Na}_2\text{CO}_3$ to an excess of an aqueous $\text{AgNO}_3$ solution. Bromic acid solution was made from dilute $\text{H}_2\text{SO}_4$ and solid $\text{Ba}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$ . $\text{KBrO}_3$ purity was 99.97%.		
			<b>ESTIMATED ERROR:</b> Nothing specified in original article. Soly: $\pm .01$ mass % (compiler) Temp: precision probably better than 0.1 K (compiler).

<b>AUXILIARY INFORMATION</b>																																					
<b>METHOD/APPARATUS/PROCEDURE:</b> Solid $\text{KBrO}_3$ and ethanol containing $\text{LiCl}$ were placed in a glass flask, and the flask rotated in a thermostat at 15.000°C for about 12 hours. The authors state that 12 hours are sufficient to insure equilibrium. For the analysis 25 $\text{cm}^3$ of the filtered alcoholic solution was placed in a small flask and evaporated in a boiling water bath while $\text{N}_2$ gas was forced through the liquid. The precipitated $\text{KBrO}_3$ was titrated iodometrically. Although not specifically stated, it appears that the $\text{LiCl}$ concentrations in the above table are <i>initial</i> concentrations.	<b>SOURCE AND PURITY OF MATERIALS:</b> Analytical reagent grade $\text{KBrO}_3$ was recrystallized twice. Ethanol was treated first with lime, then with $\text{KOH}$ , with silver oxide and with aluminum amalgam. Finally, it was distilled from water-free sulfanilic acid in a stream of $\text{N}_2$ . The boiling point was 78.03°C. $\text{LiCl}$ prepared from purified carbonate and $\text{HCl}$ , and dried in a stream of $\text{HCl}$ . $\text{LiCl}$ concentration determined gravimetrically. <table border="1" data-bbox="704 1600 1253 1729" style="margin-top: 10px;"> <thead> <tr> <th colspan="2"><b>ESTIMATED ERROR:</b></th> </tr> </thead> <tbody> <tr> <td>Soly:</td> <td>precision within 0.6 % (compiler).</td> </tr> <tr> <td>Temp:</td> <td>precision <math>\pm 0.0025</math> K.</td> </tr> </tbody> </table> <b>REFERENCES:</b>	<b>ESTIMATED ERROR:</b>		Soly:	precision within 0.6 % (compiler). <b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Furfural and an excess of solute were agitated for 24 hours in a constant-temperature bath. After agitation the mixture was filtered at the same temperature as that employed for saturation. For the determination of the amount of the salt in furfural, about 40 grams of the solution were accurately weighed in a beaker, and $100 \text{ cm}^3$ of water added; the resulting solution was evaporated until the total volume was reduced to about $10 \text{ cm}^3$ . The solution was transferred to a weighed crucible, and then the evaporation continued to dryness. The residue contained in the crucible was moistened with a few drops of concentrated $\text{H}_2\text{SO}_4$ and ignited at about $700^\circ\text{C}$ , and then weighed as the sulfate. All determinations were made in duplicate.	<b>SOURCE AND PURITY OF MATERIALS:</b> Furfural used was purified by carefully fractionating the technical grade twice under about 12 mm pressure (boiling point $54\text{--}55^\circ\text{C}$ ) through a well insulated 7-foot (2.13 meter) Hempel column packed with 7 mm Rasching rings. C.p. grade $\text{KBrO}_3$ was used.				
	<b>ESTIMATED ERROR:</b> Soly: duplicates checked within 25 % of each other. Temp: nothing specified.

<b>COMPONENTS:</b> (1) Potassium bromate; $\text{KBrO}_3$ ; [7758-01-2] (2) N-Methylacetamide; $\text{C}_3\text{H}_7\text{NO}$ ; [79-16-3]	<b>ORIGINAL MEASUREMENTS:</b> Dawson, L.R.; Berger, J.E.; Vaughn, J.W.; Eckstrom, H.C.  <i>J. Phys. Chem.</i> <u>1963</u> , <i>67</i> , 281-3.
<b>VARIABLES:</b>  T/K = 313	<b>PREPARED BY:</b>  Hiroshi Miyamoto and Mark Salomon
<b>EXPERIMENTAL VALUES:</b>  The solubility of $\text{KBrO}_3$ in n-methylacetamide, $\text{CH}_3\text{CONHCH}_3$ , at $40^\circ\text{C}$ was given as $0.03 \text{ mol dm}^{-3}$	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> An "approximate" solubility was determined by the conductivity method. About 0.5 to 1.0 gram of salt and 10 ml of solvent were placed in a large test tube, stoppered and covered with aluminum foil, and heated to $60^\circ\text{C}$ . Upon cooling to $40^\circ\text{C}$ , the occurrence of precipitation was assumed to indicate the existence of a saturated solution. Conductivities were measured in duplicate in "the usual manner." Experimental details and the measured electrolytic conductivities were not given. The concentration of the salt in the saturated solution was determined from the experimental electrolytic conductivities, but details on the calculation were not given. Presumably the limiting law was used as in (1).	<b>SOURCE AND PURITY OF MATERIALS:</b> N-Methylacetamide was prepared by reacting monoethylamine with glacial acetic acid and subsequent heating to distill off the water. The product was purified by fractional distillation followed by five or more fractional freezing cycles. The electrolytic conductance of the purified solvent ranged from $0.5 \times 10^{-5}$ to $2 \times 10^{-5} \text{ cm}^{-1}$ . Reagent grade $\text{KBrO}_3$ was dried in a vacuum desiccator over anhydrous magnesium perchlorate without further treatment.  <b>ESTIMATED ERROR:</b> Soly: authors "believe" the solubility to be accurate to within 5%. Temp: not specified.  <b>REFERENCES:</b> 1. Dawson, L.R.; Wilhoit, E.D.; Holmes, R.R.; Sears, P.G. <i>J. Am. Chem. Soc.</i> <u>1957</u> , <i>79</i> , 3004 ( $\Lambda^\infty$ values are given in this paper).

<b>COMPONENTS:</b> (1) Potassium bromate; $\text{KBrO}_3$ ; [7789-38-0] (2) Ammonia; $\text{NH}_3$ ; [7664-41-7]	<b>ORIGINAL MEASUREMENTS:</b> Hunt, H.; Boneyk, L. <i>J. Am. Chem. Soc.</i> <u>1933</u> , 55, 3528-30.
<b>VARIABLES:</b> $T/K = 298.15$	<b>PREPARED BY:</b> Mark Salomon and Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b> <p>The solubility of <math>\text{KBrO}_3</math> in liquid ammonia at <math>25^\circ\text{C}</math> was reported as</p> <p style="text-align: center;">0.002 g/100g <math>\text{NH}_3</math>.</p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> Two methods were used as described in (1). <u>Method I.</u> 25 ml test tubes with a constriction at the middle were employed. About 10-25 g $\text{NH}_3$ were condensed in the bottom, and the dry salt contained in a small tube tightly covered with cotton cloth was added to the test tube: this small tube remained in the upper part of the test tube as it could not pass the constriction in the middle of the test tube. The top of the test tube was drawn to a tip and sealed, and the tube inverted and placed in a thermostat at $25^\circ\text{C}$ . Equilibrium between $\text{NH}_3$ and the excess salt in the small covered tube required 1-3 weeks with periodic shaking. The test tube was then inverted and only the satd sln drained into the lower end (excess solid remained in the small tube covered with the cotton cloth). The sln was frozen and sealed at the constriction, and weighed. The seal was then broken and the $\text{NH}_3$ boiled off, and the residue weighed. <u>Method II.</u> Excess $\text{NH}_3$ was condensed on a weighed amount of salt in a tube fitted with a stopcock. After thermostating at $25^\circ\text{C}$ , $\text{NH}_3$ was slowly permitted to escape through the stopcock until a crystal of solid appeared and remained undissolved upon prolonged shaking. Authors state that the error due to the condensation of gaseous $\text{NH}_3$ was not significant since the dead space was kept to a minimum of about 30 $\text{cm}^3$ . However this amount of dead space was stated to limit the precision of the method to 0.5 %.	<b>SOURCE AND PURITY OF MATERIALS:</b> Reagent grade $\text{KBrO}_3$ was recrystallized three times from water and then from "a suitable" anhydrous solvent. The salt was dried to a constant weight in a vacuum oven. Purification of $\text{NH}_3$ not specified, but probably similar to that described in (1). In (1) commercial anhyd ammonia was stored over metallic sodium for several weeks before use. <b>ESTIMATED ERROR:</b> Soly: accuracy probably around $\pm 1-2\%$ (compilers). Temp: $25 + 0.025^\circ\text{C}$ accuracy established by NBS calibration as described in (1). <b>REFERENCES:</b> 1. Hunt, H.; <i>J. Am. Chem. Soc.</i> <u>1932</u> , 54, 3509.

<p>CRITICAL EVALUATION:</p> <p style="text-align: center;">THE BINARY SYSTEM</p> <p>The solubility of rubidium bromate in water has been reported in 3 publications (1-3): note that the compilation for Ref. (3) is given in the <math>\text{KBrO}_3</math> chapter. The solid phase in all cases was reported (2,3) to be the anhydrous salt. Breusov et al. (2) report a small break at 311.2 K when <math>\log(\chi)</math> was plotted as a function of T/K. Since the solid phase is the anhydrous salt and since both dilatometric and X-ray studies showed no signs of polymorphism, these authors concluded that this phenomenon may be due to large changes in hydration of the ions in solution. When the evaluators plotted the simple function of solubility as a function of T/K, a smooth monotonous curve was obtained with no indication of any breaks.</p> <p>Buell and McCrosky (1) determined a melting point of 603 K for <math>\text{RbBrO}_3</math>.</p> <p>In all cases the solubilities of Bruesov et al. (2) are slightly higher than those of Buell and McCrosky (1), the maximum difference being close to 3% at 298.2 K. Since it is not possible to determine any sources of error in either study (1-3), we have uncritically fitted all data points to the smoothing equations (see the compilations for the experimental results and compilers' conversions). For mole fraction solubilities we derive the following smoothing equation:</p> $Y_x = -14463.4/(T/K) - 32.984\ln(T/K) + 218.108 + 0.025875(T/K) \quad [1]$ $\sigma_y = 0.024 \quad \sigma_x = 1.1 \times 10^{-4}$ <p>For solubilities in mol <math>\text{kg}^{-1}</math> units we obtain the following equation:</p> $Y_m = -5626.5/(T/K) - 7.185\ln(T/K) + 63.842 \quad [2]$ $\sigma_y = 0.012 \quad \sigma_m = 0.0071$ <p>Solubilities calculated from eqs. [1] and [2] are designated as <i>tentative</i> solubilities, and values at rounded temperatures are given in the Table following the references.</p> <p style="text-align: center;">REFERENCES</p> <ol style="list-style-type: none"> <li>Buell, H. <b>AUXILIARY INFORMATION</b>																																																
<b>METHOD/APPARATUS/PROCEDURE:</b> <p>The method for determining the solubility is similar to that described in ref 1. Mixtures of rubidium bromate and water were shaken in a thermostat. About 5 hours were required to attain equilibrium. Two methods of analysis were used. In the first method, aliquots of the saturated solutions were weighed, carefully evaporated to dryness, and dried at <math>115^\circ\text{C}</math> to constant weight. In the second method, the iodometric method was used to determine the bromate concentration. Both methods were of equal precision.</p>	<b>SOURCE AND PURITY OF MATERIALS:</b> <p><math>\text{RbCl}</math> of "doubtful purity" was converted to the alum, recrystallized, and digested with excess <math>\text{BaCO}_3</math> on a hot plate. The sln was filtered, treated with <math>\text{Ba(OH)}_2</math> and <math>\text{CO}_2</math>, and filtered again. The salt was then treated with excess "pure" bromic acid and allowed to crystallize. The resulting <math>\text{RbBrO}_3</math> was recrystallized three times.</p> <p>Source and purity of water not specified.</p> <b>ESTIMATED ERROR:</b> Soly: precision in analyses about $\pm 0.3\%$ (compilers), standard deviations for solubility measurements given in table calculated by the compilers. Temp: nothing specified.

<b>AUXILIARY INFORMATION</b>																																																								
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, soly detd in apparatus shown in figure. At equilibrium, the apparatus was tilted to allow saturated solution to filter through connecting tube into weighed test tubes. The test tube was closed with a stopper, withdrawn, and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary soly vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat. Bromate was determined iodometrically.	<b>SOURCE AND PURITY OF MATERIALS:</b> Results of analysis of $\text{RbBrO}_3$ ; Content of $\text{RbBrO}_3$ = 98.6 %. <b>AUXILIARY INFORMATION</b>																																																																															
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal relief of supersaturation method. Super saturated solutions were prepared, and the solid and liquid phases separated. The mother liquor was equilibrated at 25°C for 24 hours. The number of moles of the anion was determined by iodometric titration. Alkali metal contents were determined in the same sample by the method of flame photometry from three parallel analyses. In each analysis the authors calculated the sum of cations. The composition of the solid phases was established by the Schreinemakers' method of residues. The authors did not give a phase diagram.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade $\text{RbBrO}_3$ and $\text{CsBrO}_3$ were recrystallized from double distilled water.

## CRITICAL EVALUATION:

## THE BINARY SYSTEM

Data for the solubility of cesium bromate in water have been reported in five publications (1-5). The compilations based on references (4, 5) are given in the chapters on KBrO<sub>3</sub> and RbBrO<sub>3</sub>, respectively. The isothermal method was used in all studies, and in (3-5) the solid phase was determined to be the anhydrous salt. Buell and McCrosky (2) reported a melting point of 693 K for the pure salt. A summary of the experimental solubility data is given in Table 1. Solubilities in mol kg<sup>-1</sup> units are given in the compilations.

Table 1. Summary of Experimental Solubilities<sup>a</sup>

<sup>a</sup>Conversions to mole fraction units by evaluators.

<sup>b</sup>Rejected data points (see text for discussion).

<sup>c</sup>Original units are g/100 g H<sub>2</sub>O, and conversion to mass % by evaluators.

Inspection of Table 1 shows that all data reported by Buell and McCrosky (1,2) are significantly lower than corresponding data from (3,4,5) by as much as 6%. All data reported in (1,2) were rejected. Breusov et al. (3) find that when log( $\chi$ ) is plotted as a function of T/K, a break in the curve is observed at 300 K, and which is attributed to a change in hydration of ions in solution. However the evaluators plotted the simple function of mole fraction vs T/K, and we find a smooth monotonous curve in which only the data point at 293.2 K falls off the curve. In fitting the data to the smoothing equation, again it is found that the point at 293.2 K from (3) deviates significantly from the calculated value (for all data points in Table 1 except those from (1,2), we find that  $\chi_{\text{exptl}} = 0.001472$  compared to the calculated value of  $\chi = 0.002008$ ). Using our criteria that all acceptable data points should not be greater or less than  $2\sigma_x$  from the smoothed calculated values, one more data point from (3) at 363.2 K was rejected. The final smoothing equation based on the 12 remaining data points based on mole fraction units is:

$$Y_x = -32233.93/(T/K) - 137.0375 \ln(T/K) + 825.2493 + 0.178260(T/K) \quad [1]$$

$$\sigma_y = 0.018$$

$$\sigma_x = 2.8 \times 10^{-5}$$

Based on the 12 acceptable data points, the derived smoothing equation based on mol kg<sup>-1</sup> units is:

$$Y_m = -6754.46/(T/K) - 10.4410 \ln(T/K) + 82.116 \quad [2]$$

$$\sigma_y = 0.013$$

$$\sigma_m = 0.0067$$

Solubilities calculated from eqs. [1] and [2] are designated as *tentative* values, and calculated solubilities at rounded temperatures are given in Table 2.

<b>AUXILIARY INFORMATION</b>																															
<b>METHOD/APPARATUS/PROCEDURE:</b> The method for determining the solubility is similar to that described in ref 1. Mixtures of cesium bromate and water were agitated in a thermostat. About 5 hours were required to attain equilibrium. Two methods of analysis were used. In the first method, aliquots of the saturated solutions were weighed, carefully evaporated to dryness, and dried at 115°C to constant weight. In the second method, the iodometric method was used to determine the bromate concentration. Both methods were of equal precision.	<b>SOURCE AND PURITY OF MATERIALS:</b> Nothing specified, but the compiler assumes that the preparation of cesium bromate was similar to that described in ref 1.  <b>ESTIMATED ERROR:</b> Soly: precision in analyses about ± 0.3 % (compilers). Standard deviations for solubility measurements given in table calculated by compilers. Temp: nothing specified.  <b>REFERENCES:</b> 1. McCrosky, C.R.; Buell, H.D. <i>J. Am. Chem. Soc.</i> <u>1920</u> , <i>42</i> , 1786.

<b>AUXILIARY INFORMATION</b>																																																								
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, soly detd in apparatus shown in figure. At equilibrium, the apparatus was tilted to allow satd sln to filter through connecting tube into weighed test tubes. The test tube was closed with a stopper, withdrawn, and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary soly vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat. Bromate was determined iodometrically.	<b>SOURCE AND PURITY OF MATERIALS:</b> Results of analysis of CsBrO <sub>3</sub> : Content of CsBrO <sub>3</sub> = 99.3 % Impurities(mass %): K <0.002; Rb 0.09; Na 0.0025; SO <sub>4</sub> 0.05; Fe 0.005.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. ## CRITICAL EVALUATION:

## THE BINARY SYSTEM

Solubility data for  $\text{LiIO}_3$  in water have been reported in 37 publications (1-34, 44-46). At 298.2 K Shklovskaya et al. (5,7,8,11,14-20,22,23,25,27,28,44) reported the identical solubility of 43.82 mass %, and although the work spans a period of 10 years (1974-1983), it is not possible to determine the number of independent measurements in these 18 publications. The solubility of 43.30 mass % at 298.2 K reported in (24) is distinctly lower than all other findings and is therefore rejected. Unezawa et al. (33) reported the solubility to be about 76 g/100 g  $\text{H}_2\text{O}$  (43.2 mass %) over the temperature range of 278-343 K, and although this is an interesting result its qualitative nature led us to conclude that it should not be compiled. However the importance of this paper is that the authors identified the stable solid phase at room temperature as hexagonal  $\text{LiIO}_3$  (i.e. the  $\alpha$ -phase) which is consistent with other quantitative data as discussed below. A graphical summary of the solubility of  $\text{LiIO}_3$  in water is given in the polytherm figure below. In all cases the equilibrated solid phase is the anhydrous salt.

Figure 1. Solubility of  $\text{LiIO}_3$

<p>COMPONENTS:</p> <p>(1) Lithium Iodate; <math>\text{LiIO}_3</math>; [13765-03-2]</p> <p>(2) Water; <math>\text{H}_2\text{O}</math>; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto Niigata University Niigata, Japan and M. Salomon US Army ET &amp; DL Fort Monmouth, NJ, USA</p> <p>February 1986</p>
<p>CRITICAL EVALUATION:</p> <p>There are a number of problems in critically evaluating the data in the figure, and this is undoubtedly due to the uncertainties in the form of the solid phase. <math>\text{LiIO}_3</math> is polymorphic, and according to (35,36) the stable structure is hexagonal with 2 molecules per unit cell with lithium and iodine both lying within oxygen octahedra. By growing crystals from saturated solutions at 343 K, Unezawa et al. (33) were able to identify the less stable tetragonal form of <math>\text{LiIO}_3</math> (the <math>\beta</math>-phase), and solubilities for the <math>\alpha</math>-phase and <math>\beta</math>-phase were published in graphical form in (34). In (34) the solubility of stable <math>\alpha</math>-<math>\text{LiIO}_3</math> appears to be constant at 80 g/100 g <math>\text{H}_2\text{O}</math> (44.4 mass %) between 298-353 K (see the compilation for this figure). According to (34) the transition between <math>\alpha</math>-<math>\text{LiIO}_3</math> and <math>\beta</math>-<math>\text{LiIO}_3</math> occurs at 343 K. The Lithium Iodate Crystal Research Group in The Peoples Republic of China (37) investigated saturated and supersaturated solutions of <math>\alpha</math>-<math>\text{LiIO}_3</math> (hexagonal) and <math>\beta</math>-<math>\text{LiIO}_3</math> (tetragonal) as a function of temperature, and reported that when crystals co-exist, <math>\alpha</math>-<math>\text{LiIO}_3</math> is more stable below 333 K. This paper contains only graphical data and therefore was not compiled.</p> <p>Desvignes and Romissent (38) used X-ray diffraction to demonstrate that the stable solid at room temperature is <math>\alpha</math>-<math>\text{LiIO}_3</math> and that there is an irreversible change to <math>\beta</math>-<math>\text{LiIO}_3</math> when the crystals are heated to 528 K: this is similar to the irreversible transformation temperature of 533 K reported in (33). Liminga and Abrahams (39) also reported that the stable solid at room temperature is <math>\alpha</math>-<math>\text{LiIO}_3</math>.</p> <p>To complicate matters, Ricci and Amron (2) reported a third phase, an octahedral form, stable at higher temperatures, metastable down to 283 K, and the transition between stable and metastable solutions for this new solid occurs at around 328 K. This solid phase was identified by microscopic analysis, but X-ray confirmation has not been reported. Since the polytherm for Ricci and Amron's octahedral phase lies fairly close to that for the tetragonal form reported by Unezawa and Tatuoka (34), it would appear to the evaluators that both are identical: i.e. that the quantitative solubilities of the octahedral form are in fact the solubilities for the less stable tetragonal form: i.e. for <math>\beta</math>-<math>\text{LiIO}_3</math>. It should be noted that Ricci and Amron used (after purification) a commercial salt and a product prepared by metathesis, and both salts were dried at 383-456 K before use.</p> <p>In view of the above uncertainties in the nature of the solid phases and the scatter in the reported solubilities (see figure), we are only able to make limited recommendations on the solubility of <math>\text{LiIO}_3</math> as a function of temperature. There is no doubt that at room temperature the stable solid phase is <math>\alpha</math>-<math>\text{LiIO}_3</math> and that its solubility at 298.2 K is probably close to 43.82 mass % (i.e. <math>\chi = 0.0717</math> and <math>m = 4.29 \text{ mol kg}^{-1}</math>). Transition to the <math>\beta</math>-phase probably occurs between 313-328 K, and the solubility of <math>\beta</math>-<math>\text{LiIO}_3</math> as a function of temperature is probably the same as those reported by Ricci and Amron for the so-called octahedral phase. The reported solubilities at 313 K (13) and 323 K (3,4,6,10) appear imprecise and probably can be attributed to mixed (<math>\alpha</math>- and <math>\beta</math>-) solid phases. We cannot offer either <i>tentative</i> or <i>recommended</i> solubilities at this time.</p> <p style="text-align: center;">TERNARY SYSTEMS</p> <p>1. One Saturating Component.</p> <p>1.1. The solubility of lithium iodate in aqueous iodic acid solution.</p> <p>Shklovskaya et al. (13) determined the solubility of lithium iodate in 10 mass % iodic acid solution over a wide temperature range. The solubility was found to exhibit a minimum near 363 K.</p>	

<p>COMPONENTS:</p> <p>(1) Lithium iodate; <math>\text{LiIO}_3</math>; [13765-03-2]</p> <p>(2) Water; <math>\text{H}_2\text{O}</math>; [7732-18-5]</p>	<p>EVALUATOR: H. Miyamoto Niigata University Niigata, Japan</p> <p style="text-align: right;">February, 1986</p>																																
<p>CRITICAL EVALUATION:</p> <p>1.2. The solubility of lithium iodate in ethanol-water mixtures.</p> <p>Arkhipov, Pruntsev and Kidyarov (40) have measured the solubility of lithium iodate in mixtures of ethanol and water, but reported only graphical data. The figure with some comments is included in the compilation section of this chapter.</p> <p>2. Two Saturating Components.</p> <p>Solubility data for the ternary aqueous systems have reported in a number of publications which are summarized in Tables 1-4.</p> <p><u>The System With Iodic Acid.</u> The system has been reported in 3 publications (2,3,13) at the three temperatures 298, 313 and 323 K, and phase diagrams at each temperature were also included. The dominant feature in this system is the formation of solid solutions <math>m\text{LiIO}_3 \cdot n\text{HIO}_3</math> where m and n were not specified.</p> <p>Lukasiewicz, Pietaszemska and Zmija (41) measured solubilities in the ternary <math>\text{LiIO}_3 - \text{HIO}_3 - \text{H}_2\text{O}</math> system at 313, 323, and 328 K. The pH range of the saturated solutions was 1.9 to 3.5. The composition in the solid phase was not reported.</p> <p><u>The System With Lithium Hydroxide.</u> Solubilities in the <math>\text{LiIO}_3 - \text{LiOH} - \text{H}_2\text{O}</math> system were studied by the isothermal method at 298 K (9). Lithium hydroxide and iodate exists in a restricted series of solid solutions.</p> <p><u>Systems With Alkali Metal Iodates.</u> Solubility studies for ternary aqueous systems with alkali metal iodates have been reported in 4 publications (4-7). The summary of these studies is given in Table 1.</p> <p>The ternary systems with <math>\text{NaIO}_3</math> and <math>\text{CsIO}_3</math> are simple eutonic, and no double salts were found. The dominant feature of the ternary systems with <math>\text{KIO}_3</math> and <math>\text{RbIO}_3</math> is the existence of double salts, <math>\text{KIO}_3 \cdot 2\text{LiIO}_3</math> and <math>\text{RbIO}_3 \cdot 2\text{LiIO}_3</math>, respectively.</p> <p style="text-align: center;">Table 1. Summary for Solubility Studies of the Ternary Systems with Alkali Metal Iodates</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Ternary System</th> <th style="text-align: center;">T/K</th> <th style="text-align: left;">Solid Phase</th> <th style="text-align: center;">Reference</th> </tr> </thead> <tbody> <tr> <td><math>\text{LiIO}_3 + \text{NaIO}_3 + \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td><math>\text{LiIO}_3</math>; <math>\text{NaIO}_3 \cdot \text{H}_2\text{O}</math></td> <td style="text-align: center;">5</td> </tr> <tr> <td><math>\text{LiIO}_3 + \text{KIO}_3 + \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td><math>\text{LiIO}_3</math>; <math>\text{KIO}_3</math>; <math>\text{KIO}_3 \cdot 2\text{LiIO}_3</math></td> <td style="text-align: center;">7</td> </tr> <tr> <td><math>\text{LiIO}_3 + \text{KIO}_3 + \text{H}_2\text{O}</math></td> <td style="text-align: center;">323</td> <td><math>\text{LiIO}_3</math>; <math>\text{KIO}_3</math>; <math>\text{KIO}_3 \cdot 2\text{LiIO}_3</math></td> <td style="text-align: center;">4</td> </tr> <tr> <td><math>\text{LiIO}_3 + \text{RbIO}_3 + \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td><math>\text{LiIO}_3</math>; <math>\text{RbIO}_3</math>; <math>\text{RbIO}_3 \cdot 2\text{LiIO}_3</math></td> <td style="text-align: center;">7</td> </tr> <tr> <td><math>\text{LiIO}_3 + \text{RbIO}_3 + \text{H}_2\text{O}</math></td> <td style="text-align: center;">323</td> <td><math>\text{LiIO}_3</math>; <math>\text{RbIO}_3</math>; <math>\text{RbIO}_3 \cdot 2\text{LiIO}_3</math></td> <td style="text-align: center;">6</td> </tr> <tr> <td><math>\text{LiIO}_3 + \text{CsIO}_3 + \text{H}_2\text{O}</math></td> <td style="text-align: center;">298</td> <td><math>\text{LiIO}_3</math>; <math>\text{CsIO}_3</math></td> <td style="text-align: center;">5</td> </tr> <tr> <td><math>\text{LiIO}_3 + \text{CsIO}_3 + \text{H}_2\text{O}</math></td> <td style="text-align: center;">323</td> <td><math>\text{LiIO}_3</math>; <math>\text{CsIO}_3</math></td> <td style="text-align: center;">6</td> </tr> </tbody> </table> <p><u>Systems With Alkaline Earth Metal Iodates.</u> Solubility studies for these systems have been reported in 4 publications (29-32), and are summarized in Table 2.</p> <p>The ternary system with <math>\text{Mg}(\text{IO}_3)_2</math> was studied at 298 and 323 K. No double salts were formed at 298 K, and the system is one of the eutonic type. In the study at 323 K, lithium and magnesium iodates form a restricted series of solid solutions. The dominant feature of the ternary systems containing calcium iodate is the absence of double salts: the phase diagrams are of the eutonic type.</p>		Ternary System	T/K	Solid Phase	Reference	$\text{LiIO}_3 + \text{NaIO}_3 + \text{H}_2\text{O}$	298	$\text{LiIO}_3$ ; $\text{NaIO}_3 \cdot \text{H}_2\text{O}$	5	$\text{LiIO}_3 + \text{KIO}_3 + \text{H}_2\text{O}$	298	$\text{LiIO}_3$ ; $\text{KIO}_3$ ; $\text{KIO}_3 \cdot 2\text{LiIO}_3$	7	$\text{LiIO}_3 + \text{KIO}_3 + \text{H}_2\text{O}$	323	$\text{LiIO}_3$ ; $\text{KIO}_3$ ; $\text{KIO}_3 \cdot 2\text{LiIO}_3$	4	$\text{LiIO}_3 + \text{RbIO}_3 + \text{H}_2\text{O}$	298	$\text{LiIO}_3$ ; $\text{RbIO}_3$ ; $\text{RbIO}_3 \cdot 2\text{LiIO}_3$	7	$\text{LiIO}_3 + \text{RbIO}_3 + \text{H}_2\text{O}$	323	$\text{LiIO}_3$ ; $\text{RbIO}_3$ ; $\text{RbIO}_3 \cdot 2\text{LiIO}_3$	6	$\text{LiIO}_3 + \text{CsIO}_3 + \text{H}_2\text{O}$	298	$\text{LiIO}_3$ ; $\text{CsIO}_3$	5	$\text{LiIO}_3 + \text{CsIO}_3 + \text{H}_2\text{O}$	323	$\text{LiIO}_3$ ; $\text{CsIO}_3$	6

<u>Systems With Rare Earth Iodates:</u> Recently, two ternary systems (14,24) were studied by the isothermal method at 298 K. The systems $\text{LiIO}_3\text{-Sm}(\text{IO}_3)_3\text{-H}_2\text{O}$ (14) and $\text{LiIO}_3\text{-Nd}(\text{IO}_3)_3\text{-H}_2\text{O}$ (24) were of the eutonic type, and no double salts were reported.			
<u>Systems With The Other Iodates.</u> Solubility studies of the ternary aqueous systems containing lithium iodate and other iodates (with the exception of the above systems) have been reported in 9 publications (11,12,19-23,25,44), and summary of these studies is given in Table 3.

<b>AUXILIARY INFORMATION</b>							
<b>METHOD/APPARATUS/PROCEDURE:</b> The salt and water were placed in a bottle and the bottle agitated in a constant temperature bath for a long time (time not specified). After the saturated solution settled, an aliquot for analyses was removed with a pipet. $\text{LiIO}_3$ was determined by evaporation to dryness. The density of the saturated solution was also determined.	<b>SOURCE AND PURITY OF MATERIALS:</b> The salt used was purchased as a "pure chemical" and trace impurities were absent.  <b>ESTIMATED ERROR:</b> Soly: precision $\pm 1\%$ . Temp: nothing specified.  <b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>																																																																												
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Many measurements were made in an attempt to determine the stable solubility curve of the forms of $\text{LiIO}_3$ from 10 to 95°C. The solubility curve was determined with some points approached from undersaturation, some from supersaturation, and a few from both directions. The values obtained represent measurements agreeing on repeated analysis with continued stirring at each temperature. For each point, the solid phase was examined microscopically.	<b>SOURCE AND PURITY OF MATERIALS:</b> Some of the lithium iodate was made by purification of two samples of commercial c.p. material which assayed ~97% $\text{LiIO}_3$ . One sample contained insoluble $\text{Ba}(\text{IO}_3)_2$ and gave an acid reaction. Part of it was simply recrystallized twice, and part was neutralized with Kahlbaum $\text{LiOH}$ before the second crystallization. The other sample contained insoluble $\text{Li}_2\text{CO}_3$ and gave an alkaline reaction; this was neutralized with iodic acid and $\text{LiOH}$ before two recrystallizations. The rest of the salt used was made from Kahlbaum $\text{Li}_2\text{CO}_3$ and c.p. iodic acid using $\text{LiOH}$ for final neutralization. The final product was obtained by slow evaporation with stirring on a hot-plate. After decantation, the crystals were filtered by suction and washed with water. Ground and dried at 110-180°C, the product was found to be 99.9 to 100.1% pure by determination of lithium as $\text{Li}_2\text{SO}_4$ , and iodate by titration with $\text{Na}_2\text{S}_2\text{O}_3$ solution.																																																																											
<b>ESTIMATED ERROR:</b> Soly: precision about 0.1 % (compiler). Temp: precision about ± 0.05 K (compiler).																																																																												

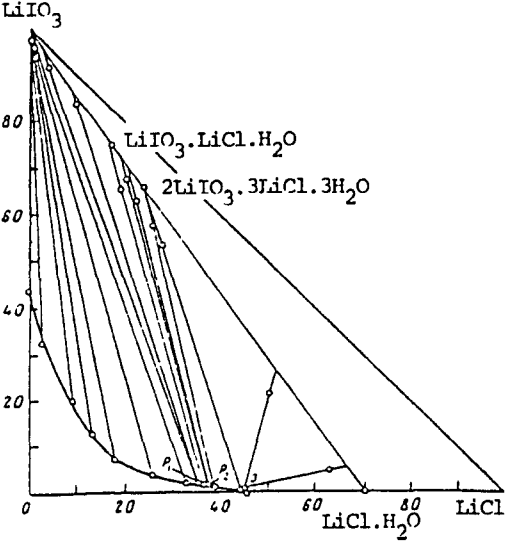

<b>COMPONENTS:</b> (1) Lithium iodate; $\text{LiIO}_3$ ; [13765-03-2] (2) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Umezawa, T.; Tatuoka, S. <i>Jpn. J. Appl. Phys.</i> <u>1972</u> , 11, 408.
<b>VARIABLES:</b> Two crystal forms: hexagonal and tetragonal Temperature: $T/K = 278-253$	<b>PREPARED BY:</b> Hiroshi Miyamoto and Mark Salomon
<b>EXPERIMENTAL VALUES:</b> The solubilities of solutions in equilibrium with hexagonal and tetragonal solid phases were reported in graphical form. The polytherms are reproduced in the figure below. <div style="text-align: center;"> </div>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions starting with hexagonal or tetragonal crystals prepared at room temperature. Solutions were then stirred for 4-5 hours at the desired temperature. About 10 ml of the saturated solution were placed in a weighing bottle using a pipet with a filter at its tip. The solvent was evaporated in an oven, and the lithium iodate solubility determined gravimetrically. The pH of the saturated solutions varied between 8.3 and 8.7. The hexagonal $\rightarrow$ tetragonal transition temperature is around 40°C. As reported in an earlier publication (1), the solubility of hexagonal $\text{LiIO}_3$ is nearly constant over the temperature range studied. Note that reference (1) has not been rejected, and therefore this paper has not been compiled.	<b>SOURCE AND PURITY OF MATERIALS:</b> Nothing specified. <b>ESTIMATED ERROR:</b> Nothing specified. <b>REFERENCES:</b> 1. <b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method used. Equilibrium was reached in 5-6 days. The liquid and solid phases were analyzed for $\text{Li}^+$ by the periodate method. Iodate was determined by titration with sodium thiosulfate in the presence of $\text{H}_2\text{SO}_4$ and KI and $\text{NH}_4^+$ was determined gravimetrically with sodium tetraphenylborate. The composition and nature of the solid phases were found by use of Schreinemakers' method of residues, X-ray diffraction, thermography and infrared spectroscopy.			<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units).		
<b>SOURCE AND PURITY OF MATERIALS:</b> Lithium iodate was prepd from lithium carbonate and iodic acid. $\text{NH}_4\text{IO}_3$ was prepd by mixing a slight excess of $\text{NH}_4\text{OH}$ with $\text{HIO}_3$ in water. The precipitate was then filtered and washed to remove the excess $\text{NH}_3$ .					
<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.1 K.

<b>AUXILIARY INFORMATION</b>																																																																																																				
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method used. Equilibrium was reached in 15-20 days.  Aliquots of liquid phases were analyzed for iodate by iodometric titration and for sulfate gravimetrically as barium sulfate. Before precipitating the sulfate ion, the aliquots were treated with hydroxylamine hydrochloride in acidic medium to reduce $\text{IO}_3^-$ , after which iodine was removed by boiling the solution. The solid phases were identified by the method of residues, and X-ray diffraction.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units). 																																																																																																			
<b>SOURCE AND PURITY OF MATERIALS:</b> Highly pure grade $\alpha\text{-LiIO}_3$ and lithium sulfate monohydrate were used.																																																																																																				
<b>ESTIMATED ERROR:</b>  Soly: nothing specified. Temp: precision $\pm 0.1$ K.

<b>AUXILIARY INFORMATION</b>																																																																																									
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubility in the system was studied by the isothermal method. Equilibrium between the liquid and solid phases was established in 30 days.  The alkali metal content of the liquid and solid phases was determined by flame photometry, and iodate was estimated by a volumetric method. The compiler assumes that iodate content was determined iodometrically. The solid phases were identified by the method of residues, and by X-ray diffraction analysis.	<b>SOURCE AND PURITY OF MATERIALS:</b> Chemically pure $\text{LiIO}_3$ and $\text{NaIO}_3$ were recrystallized twice from aqueous solutions.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.  <b>REFERENCES:</b>

<b>METHOD/APPARATUS/PROCEDURE:</b> Solubilities were determined isothermally at 50°C in a thermostated water bath. Equilibrium in the system was reached after continual stirring for 4-5 days. The total $\text{IO}_3^-$ content in the sample was found by iodometric titration. Lithium was determined by flame photometry and the periodate method. Potassium was determined with tetraphenylborate.  The composition and nature of the solid phases were determined by Schreinemakers' method, X-ray diffraction, thermography, infrared spectroscopy, and crystallography.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade potassium iodate used. Lithium iodate prepared from lithium carbonate and $\text{HIO}_3$ . Purities checked by chemical and X-ray diffraction methods, however the results were not given. <b>ESTIMATED ERRORS:</b> Nothing specified. <b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units). 																																																																																																																																														

<b>COMPONENTS:</b> (1) Lithium iodate; $\text{LiIO}_3$ ; [13765-03-2] (2) Potassium iodate; $\text{KIO}_3$ ; [7758-05-6] (3) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Shklovskaya, R.M.; Kashina, N.I.; Arkhipov, S.M.; Kuzina, V.A.; Kidyarov, B.I. <i>Zh. <b>AUXILIARY INFORMATION</b>																																																																																																																																									
<b>METHOD/APPARATUS/PROCEDURE:</b> The compiler assumes that the isothermal method was used. Equilibrium between the liquid and solid phases was established in 14 days. The liquid and solid phases were analyzed for ions: $\text{Li}^+$ by the periodate method, $\text{Rb}^+$ gravimetrically with sodium tetraphenylborate, and $\text{IO}_3^-$ by iodometric titration in sulfuric acid solution.  To determine the composition and nature of solid phases formed in the systems, the authors used Schreinemakers' method of wet residues, X-ray diffraction, thermography, and infrared spectroscopy.	<b>SOURCE AND PURITY OF MATERIALS:</b> Lithium iodate was prepared from lithium carbonate and iodic acid. Although the purity of lithium iodate was checked by chemical, thermal and X-ray diffraction analyses, the results were not given. C.p. grade rubidium iodate was used.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b>																																																																																																																																								

## COMPONENTS:

- (1) Lithium iodate;  $\text{LiIO}_3$ ; [13765-03-2]  
 (2) Rubidium iodate;  $\text{RbIO}_3$ ; [13446-76-9]  
 (3) Water;  $\text{H}_2\text{O}$ ; [7732-18-5]

## EVALUATOR:

Karataeva, I.M.; Vinogradov, E.E.  
*Zh. Neorg. Khim.* 1974, 19, 3156-60;  
*Russ. J. Inorg. Chem. (Engl. Transl.)*  
 1974, 19, 1726-9.

## COMMENTS AND/OR ADDITIONAL DATA:

The phase diagram for 50°C is given below

## EXPERIMENTAL VALUES (Continued)

<sup>a</sup> A =  $\text{LiIO}_3$ ; B =  $\text{RbIO}_3$ ; C =  $2\text{LiIO}_3 \cdot \text{RbIO}_3$

<sup>b</sup> The compiler assumes that  $2\text{LiIO}_3 \cdot \text{RbIO}_3 \cdot \text{RbIO}_3$  given in the original paper should read  $2\text{LiIO}_3 \cdot \text{RbIO}_3 + \text{RbIO}_3$ .

For the binary systems, the compiler computes the following:

soly of  $\text{LiIO}_3$  =  $4.191 \text{ mol kg}^{-1}$

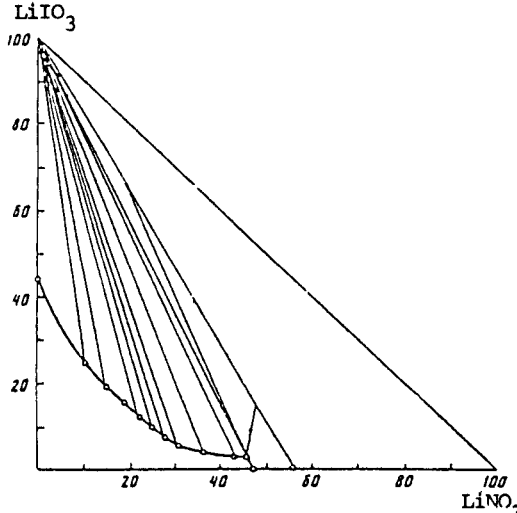

soly of  $\text{RbIO}_3$  =  $0.176 \text{ mol kg}^{-1}$

<b>COMPONENTS:</b> (1) Lithium iodate; $\text{LiIO}_3$ ; [13765-03-2] (2) Rubidium iodate; $\text{RbIO}_3$ ; [13446-76-9] (3) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Shklovskaya, R.M.; Kashina, N.I.; Arkhipov, S.M.; Kuzina, V.A.; Kidyarov, B.I. <i>Zh. Neorg. Khim.</i> 1975, 20, 783-5; <i>Russ. J. Inorg. Chem. (Engl. Transl.)</i> 1975, 20, 441-2

soly of $\text{LiIO}_3$ = 4.289 mol kg <sup>-1</sup>																																																																													
soly of $\text{RbIO}_3$ = 0.0928 mol kg <sup>-1</sup>																																																																													
<b>AUXILIARY INFORMATION</b>																																																																													
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubility in $\text{LiIO}_3$ - $\text{RbIO}_3$ - $\text{H}_2\text{O}$ system was studied by the isothermal method. Equilibrium was reached in 10 days. The iodate content in the liquid was determined iodometrically, and rubidium determined gravimetrically as the tetraphenyl borate. Lithium was determined by difference, and in several instances by flame photometry. X-ray diffraction patterns were recorded.  The composition of the solid phases were determined by the method of residues, and was checked by X-ray diffraction.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units). 																																																																												
<b>SOURCE AND PURITY OF MATERIALS:</b> Chemical pure grade $\text{LiIO}_3$ and $\text{RbIO}_3$ were used.																																																																													
<b>ESTIMATED ERROR:</b> Nothing specified.																																																																													

<b>COMPONENTS:</b> (1) Lithium iodate; $\text{LiIO}_3$ ; [13765-03-2] (2) Cesium iodate; $\text{CsIO}_3$ ; [13454-81-4] (3) Water; $\text{H}_2\text{O}$ ; [7732-18-5]		<b>ORIGINAL MEASUREMENTS:</b> Shklovskaya, R.M.; Arkhipov, S.M.; Kidyarov, E.I.; Mitnitskii, P.L.  <i>Zh. <b>AUXILIARY INFORMATION</b>			
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubility in the system was studied by the isothermal method. Equilibrium between liquid and solid phases was established in 30 days.  Lithium content in samples of the liquid and solid phases were determined by flame photometry, and cesium was determined gravimetrically as the tetraphenylborate. The authors report that iodate was determined by volumetric method. The compiler assumes that this is an iodometric titration. The solid phases were identified by the method of residues, and by X-ray diffraction analysis.		<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade $\text{LiIO}_3$ and $\text{CsIO}_3$ were recrystallized twice from aqueous solutions.	
		<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.

<b>AUXILIARY INFORMATION</b>																																																																	
<b>METHOD/APPARATUS/PROCEDURE:</b> The compiler assumes that the isothermal method was used. Equilibrium between the liquid and solid phases was established in 14 days. The liquid and solid phases were analyzed for ions: $\text{Li}^+$ by the periodate method, $\text{IO}_3^-$ by iodometric titration in sulfuric acid solution, and $\text{Cs}^+$ by difference.  To determine the composition and nature of solid phases formed in this system, the authors used Schreinemakers' method of wet residues, X-ray diffraction, thermography and infrared spectroscopy.	<b>SOURCE AND PURITY OF MATERIALS:</b> Lithium iodate was prepared from lithium carbonate and iodic acid. Although the purity of the lithium iodate was checked by chemical, thermal and X-ray diffraction analyses, the results were not given.  C.p. grade cesium iodate was used. <table border="1" data-bbox="698 1588 1253 1719" style="margin-top: 20px;"> <tbody> <tr> <td><b>ESTIMATED ERROR:</b> Nothing specified.</td> </tr> <tr> <td><b>REFERENCES:</b></td> </tr> </tbody> </table>	<b>ESTIMATED ERROR:</b> Nothing specified.	<b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>COMMENTS AND/OR ADDITIONAL DATA:</b>		
Isothermal method used. Equilibrium was established after 15-20 days. The iodate content was determined iodometrically. The phosphate concn in solution was determined colorimetrically as the vanadomolybdo-phosphate complex, and in the residues by titration after dissolving the solid in acid. The composition of the solid phase was determined by the method of residues and checked by X-ray diffraction.			The phase diagram is given below (based on mass units).		
<b>SOURCE AND PURITY OF MATERIALS:</b>					
"Pure grade" lithium iodate and chemically pure grade lithium phosphate were used.					
<b>ESTIMATED ERROR:</b>					
Soly: nothing specified. Temp: precision $\pm$ 0.1 K.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>		
The isothermal method used. Equilibrium was reached in 15-20 days. Aluminum content was determined by complexometric titration, lithium by flame photometry. The composition of the solid phases was determined by the method of residues, and checked by X-ray diffraction. The X-ray diffraction patterns were recorded on a URS-50-I diffractometer with Cu radiation. The IR spectra and thermogram were also recorded.			Aluminum iodate was prepared at 80-90°C by neutralization of a saturated solution of iodic acid with an equivalent amount of freshly precipitated aluminum hydroxide. The solution was cooled to room temperature, and the solid dried and analyzed. Found, mass %: Al 4.03; $\text{IO}_3$ 78.7; $\text{H}_2\text{O}$ 17.6. Calcd. For $\text{Al}(\text{IO}_3)_3 \cdot 6\text{H}_2\text{O}$ , mass %: Al 4.09; $\text{IO}_3$ 79.53; $\text{H}_2\text{O}$ 16.38 (by difference). "Very pure" grade $\text{LiIO}_3$ was used.		
			<b>ESTIMATED ERROR:</b>		
			Soly: error in flame photometry analysis did not exceed 1-3 rel %. Temp: precision $\pm$ 0.1 K.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> The investigation was carried out by the isothermal method. Equilibrium was reached in 25-30 days. Samples of the coexisting phases were analyzed for lithium by flame photometry. The photometry was carried out on solutions in which the lithium concentration did not exceed $10 \mu\text{g ml}^{-1}$ . The gallium content of liquid phases was determined by atomic absorption. Solutions for which the lithium and iodate ion concentrations range from 20 to $100 \mu\text{g ml}^{-1}$ do not influence the absorption of gallium. Analysis of these solutions was carried out by the restricted standards method with standard solutions based on gallium iodate. The solid phases were identified by the method of residues and checked by X-ray diffraction.			<b>SOURCE AND PURITY OF MATERIALS:</b> "Special purity" grade lithium iodate was used. Gallium iodate was made by the reaction of gallium nitrate with iodic acid.		
			<b>ESTIMATED ERROR:</b> Soly: rel. error 1-3 % (flame photometry) and 3-5 % (atomic absorption measurement). Temp: precision $\pm 0.1$ K.

<sup>a</sup> A = $\text{TlIO}_3$ ; B = $\text{LiIO}_3$ ; C = $\text{LiIO}_3 \cdot \text{TlIO}_3$				
<sup>b</sup> For binary systems the compiler computes the following: soly of $\text{LiIO}_3$ = 4.284 mol kg <sup>-1</sup> soly of $\text{TlIO}_3$ = 1.7 × 10 <sup>-3</sup> mol kg <sup>-1</sup>				
<b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method used. Equilibrium was reached in 20 days. The iodate in samples of the liquid and solid phases with low $\text{TlIO}_3$ concentrations was detd by iodometric titration, and the thallium by flame emission photometry. The lithium concentration was obtained by difference. In samples of solid phases at higher $\text{TlIO}_3$ concentrations, the thallium was detd gravimetrically as the chromate, and lithium by flame emission photometry. The compositions of the solid phases were detd by the method of residues and X-ray diffraction.		<b>SOURCE AND PURITY OF MATERIALS:</b> "Special purity" lithium iodate was used. Thallium iodate was made from thallium nitrate and lithium iodate.		
<b>ESTIMATED ERROR:</b> Soly: 0.3 rel % (samples of higher $\text{TlIO}_3$ ) and nothing specified (samples of lower $\text{TlIO}_3$ ). Temp: precision ± 0.1 K.		<b>COMMENTS AND/OR ADDITIONAL DATA:</b>

<b>AUXILIARY INFORMATION</b>																																																																																															
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method used. Equilibrium was reached in 25-30 days. The iodate concentration in the coexisting phases was determined iodometrically. The liquid phases were analyzed for titanium colorimetrically with chromotropic acid after preliminary reduction of the iodate ion with hydroxylammonium sulfate in an acidic medium followed by removal of iodine by evaporation of the solution. The lithium content was determined by difference, and also checked by flame emission spectrometry in the solutions after removal of titanium. The composition of the solid phases were determined by the method of Schreinemakers' residues and checked by X-ray diffraction.	<b>SOURCE AND PURITY OF MATERIALS:</b> $\text{Ti}(\text{IO}_3)_4 \cdot 2\text{H}_2\text{O}$ prepared by mixing freshly precipitated titanium hydroxide and a stoichiometric amount of 75 % iodic acid solution at 50 to 60°C. Purity of the product was reported as: found: Ti 6.12 %; $\text{IO}_3$ 89.63 %; $\text{IO}_3$ :Ti = 4.01. calcd for $\text{Ti}(\text{IO}_3)_4 \cdot 2\text{H}_2\text{O}$ : Ti 6.11 %; $\text{IO}_3$ 89.29 %. Special purity grade lithium iodate was used.																																																																																														
	<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.

<sup>b</sup> For binary systems the compiler computes the following: soly of $\text{LiIO}_3$ = $4.289 \text{ mol kg}^{-1}$ soly of $\text{Zr}(\text{IO}_3)_4$ = $3 \times 10^{-6} \text{ mol kg}^{-1}$																																																																						
<b>AUXILIARY INFORMATION</b>																																																																						
<b>METHOD/APPARATUS/PROCEDURE:</b> The system was studied by the isothermal method. Equilibrium was established after 15-20 days. Samples of the coexisting phases were analyzed for lithium by flame emission spectrometry. Zirconium concentrations >0.001 % in the samples of the liquid phase were determined gravimetrically by precipitation with mandelic acid; otherwise zirconium was determined photometrically with sodium hyposulfate. The solid phases were identified by the method of residues, and checked by X-ray diffraction.	<b>SOURCE AND PURITY OF MATERIALS:</b> "Special purity" grade lithium iodate was used. Zirconium iodate was prepared as follows: freshly precipitated zirconium hydroxide was treated with 60-70 % iodic acid at room temperature, and the reaction mass diluted to an iodic acid concentration of 2-4 %. The product was heated to 60-80°C and dried. The purity of the product was given as follows: Found, mass %: Zr 11.50; $\text{IO}_3$ 89.1. Molar ratio $\text{IO}_3$ :Zr = 4.01:1. Calcd for $\text{Zr}(\text{IO}_3)_4$ , mass %: Zr 11.53; $\text{IO}_3$ 88.47. The X-ray diffraction pattern of the salt obtained corresponded to that for anhydrous zirconium iodate.																																																																					
	<b>ESTIMATED ERROR:</b> Soly: rel. error in Li analysis 1-3 %. Temp: nothing specified.

<b>AUXILIARY INFORMATION</b>																																																																																										
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubility in this system was studied by the isothermal method. Equilibrium was reached in 25-30 days. Samples of the co-existing phases were analyzed for lithium by emission spectrometry, and the concentration of lithium was determined by comparing the solution being analyzed with solutions containing only lithium. The hafnium content was determined photometrically using Arsenazo III and reducing the iodate ion with hydroxylamine. The solid phases were identified by the method of residues, and the results confirmed by X-ray diffraction.	<b>SOURCE AND PURITY OF MATERIALS:</b> Lithium iodate was "highly pure" grade, and hafnium iodate obtained by the action of aqueous iodic acid solution on freshly precipitated hafnium hydroxide. The salt obtained contained 20.31 mass % Hf and 79.45 mass % $\text{IO}_3$ ; mol ratio $\text{IO}_3/\text{Hf} = 3.99$ . The product agrees with the data (1) for anhydrous hafnium iodate.  <b>ESTIMATED ERROR:</b> Soly: within 1-3 rel % (flame photometry of Li). Temp: precision $\pm 0.1 \text{ K}$ .  <b>REFERENCES:</b> 1. Deabridges, J.; Rohmer, R. <i>Bull. Soc. Chim. Fr.</i> 1968, 2, 521.																																																																																									

## COMPONENTS:

- (1) Lithium iodate;  $\text{LiIO}_3$ ; [13765-03-2]
- (2) Hafnium iodate;  $\text{Hf}(\text{IO}_3)_4$ ; [19630-06-9]
- (3) Water;  $\text{H}_2\text{O}$ ; [7732-18-5]

<b>AUXILIARY INFORMATION</b>																																																												
<b>METHOD/APPARATUS/PROCEDURE:</b> The ternary system $\text{LiIO}_3\text{-LiReO}_4\text{-H}_2\text{O}$ was investigated by the isothermal method. Equilibrium was reached in 10-15 days. Lithium in the liquid phases was determined by ion exchange, and iodate content was determined by iodometric titration in the presence of phthalate buffer at pH 5. The perrhenate concentration was found by difference. Solid phase compositions determined by the method of residues and checked by X-ray diffraction.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units). 																																																											
<b>SOURCE AND PURITY OF MATERIALS:</b> Special purity grade $\text{LiIO}_3$ was used. Lithium perrhenate was made from lithium hydroxide and perrhenate obtained by ion exchange from ammonium perrhenate.																																																												
<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.

<b>AUXILIARY INFORMATION</b>																																																																						
<b>METHOD/APPARATUS/PROCEDURE:</b> The compiler assumes that the isothermal method was used. The experiments were carried out in a water thermostat, and equilibrium was established after 30-55 days. The iodate concentration was determined by titration with sodium thiosulfate in the presence of sulfuric acid and potassium iodide, the neodymium ion by complexometric titration in the presence of hexamethylenetetramine and Methylthymol blue, and lithium by flame photometry. The composition of the solid phase was determined by Schreinemakers' method of residues, and thermogravimetry.	<b>SOURCE AND PURITY OF MATERIALS:</b> Lithium iodate synthesized from iodic acid and lithium carbonate. Neodymium iodate was made from neodymium oxide and iodic acid. The purity of the product was checked chemically.																																																																					
<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1 \text{ K}$ .	<b>COMMENTS AND/OR ADDITIONAL DATA:</b>

<b>AUXILIARY INFORMATION</b>																																																																		
<b>METHOD/APPARATUS/PROCEDURE:</b> The ternary system, $\text{LiIO}_3$ - $\text{Sm}(\text{IO}_3)_3$ - $\text{H}_2\text{O}$ , was investigated by the isothermal method. Equilibrium in the system was reached in 20-30 days. Samarium content in the liquid phase was determined by complexometric titration and lithium by flame photometry. The solid phases were identified by the method of "residues" and checked by X-ray diffraction.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units). 																																																																	
<b>SOURCE AND PURITY OF MATERIALS:</b> $\text{Sm}(\text{IO}_3)_3 \cdot 2\text{H}_2\text{O}$ prepared from samarium carbonate and iodic acid. Special purity grade $\text{LiIO}_3$ was used.																																																																		
<b>ESTIMATED ERROR:</b> Nothing specified.																																																																		

<b>COMPONENTS:</b> (1) Lithium iodate; $\text{LiIO}_3$ ; [13765-03-2] (2) Lithium hydroxide; $\text{LiOH}$ ; [1310-65-2] (3) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Tarasova, G.N.; Vinogradov, E.E.; Lepeshkov, I.N.  <i>Zh. AUXILIARY INFORMATION					
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:		
<p>Satd slns prepd by placing excess solid and freshly boiled distilled water in glass-stoppered flasks, and rotating in a const temperature water bath.</p> <p>After rotation and settling of the solid, the liquid was sampled by means of 1 ml specific gravity pipets. Solutions with at least 20 % <math>\text{H}_2\text{O}</math> were withdrawn through filter paper tips for separation of the solid. Those with less water were sampled only after sufficient settling. When the crystals were not too fine, one or two days of settling sufficed. For extremely fine ppts, separation was accomplished by centrifuging for one minute followed by replacing the bottle in the water-bath for five minutes until sufficiently clear supernatant liquid was available for sampling. Equilibrium was reached in 2 to 8 weeks depending on the composition. Equilibrium was checked for a few representative solutions in each series including the most viscous, before the whole series was analyzed. The solutions on the solubility curve of <math>\text{HIO}_3</math> were all seeded with the solid before stirring at 25°C.</p> <p style="text-align: right;">continued.....</p>			<p>Some of the lithium iodate used was made by purification of two samples of commercial c.p. material which assayed ~97% <math>\text{LiIO}_3</math>. One sample contained insoluble <math>\text{Ba}(\text{IO}_3)_2</math> and gave an acid reaction. Part of it was simply recrystallized twice and part was neutralized with Kahlbaum <math>\text{LiOH}</math> before the second crystallization. The other sample contained insoluble <math>\text{Li}_2\text{CO}_3</math> and gave an alkaline reaction; this was neutralized with iodic acid and <math>\text{LiOH}</math> followed by two recrystallizations. The rest of the salt used was made from Kahlbaum <math>\text{Li}_2\text{CO}_3</math> and c.p. iodic acid using <math>\text{LiOH}</math> for final neutralization. The final product was obtained by slow evaporation with stirring on a hot-plate. After decantation the crystals were filtered by suction and washed with water. Ground and dried at 110-180°C, the product was found to be 99.9 to 100.1 % pure by determination of lithium as <math>\text{Li}_2\text{SO}_4</math> and iodate by titration with <math>\text{Na}_2\text{S}_2\text{O}_3</math> solution.</p>

<sup>a</sup> A =  $\text{LiIO}_3$ ; B =  $\text{HIO}_3$ ; S = solid solution

<sup>b</sup> For the binary systems, the compiler computes the following:

$$\text{soly of } \text{LiIO}_3 = 4.296 \text{ mol kg}^{-1}$$

$$\text{soly of } \text{HIO}_3 = 17.42 \text{ mol kg}^{-1}$$

## AUXILIARY INFORMATION

## METHOD/APPARATUS/PROCEDURE:

In most cases equilibrium was approached presumably from super-saturation, and some cases were obtained from undersaturation. For a few of the worst cases the rotation of the tubes was started at  $\sim 45^\circ\text{C}$ , and the temperature of the water-bath was slowly lowered to  $25^\circ\text{C}$  over a period of 30 hours, the slns being seeded with  $\text{HIO}_3$  at  $\sim 36^\circ\text{C}$ . For the analysis of the saturated solutions the iodic acid content was determined by titration with standard  $\text{NaOH}$  solution, and the neutralized sample was then used for the determination of total iodate with standard  $\text{Na}_2\text{S}_2\text{O}_3$  solution in the presence of  $\text{H}_2\text{SO}_4$ .

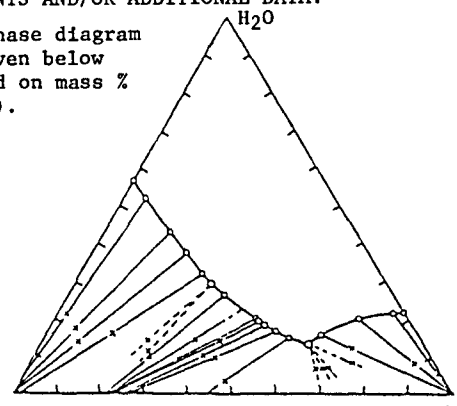

## ESTIMATED ERROR:

Soly: precision was presumed within 0.1 %.  
 Temp: precision about  $\pm 0.05$  K (compiler).

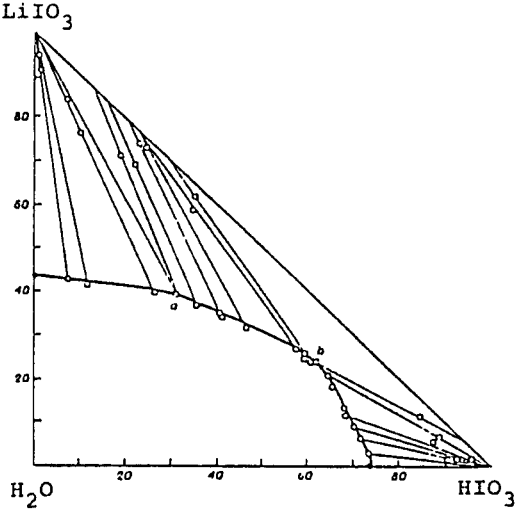

## COMMENTS AND/OR ADDITIONAL DATA:

The phase diagram is given below (based on mass % units).

<sup>a</sup> A = $\text{LiIO}_3$ ; B = $\text{HIO}_3$ ; C = $m\text{LiIO}_3 \cdot n\text{HIO}_3$																																																																																																																			
<sup>b</sup> For binary systems the compiler computes the following: soly of $\text{LiIO}_3$ = 4.20 mol $\text{kg}^{-1}$ soly of $\text{HIO}_3$ = 20.90 mol $\text{kg}^{-1}$																																																																																																																			
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of $\text{LiIO}_3$ , $\text{HIO}_3$ and $\text{H}_2\text{O}$ were stirred in a thermostat for 7-14 days. Samples were allowed to stand in the thermostat, centrifuged over a period of 1 min, thermostated again, and only then the liquid phase was separated from the solid phase. $\text{HIO}_3$ was determined by titration with a standard NaOH solution, and then the total $\text{IO}_3^-$ content in the sample was found by iodometric titration. Lithium was determined by flame photometry and the periodate method. The composition and nature of solid phases were determined by the Schreinemakers', X-ray diffraction, and thermographic methods. X-ray diffraction patterns of solid phases were recorded by the Debye-Scherrer method with an RRU-114 camera with nickel-filtered Cu-K $\alpha$ radiation.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade iodic acid used. $\text{LiIO}_3$ prepared from $\text{Li}_2\text{CO}_3$ and iodic acid. The product was analyzed chemically, and by X-ray diffraction, but the results were not given. <b>ESTIMATED ERROR:</b> Nothing specified. <b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units).

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>		
For high concentrations of $\text{LiIO}_3$ , saturated solutions were prepared isothermally. For high $\text{HIO}_3$ concentrations, saturated solutions were prepared isothermally from supersaturated solutions. Equilibrium was reached in 8 days for the former method, and in 30 days for the latter method.			"Chemically pure" grade $\text{LiIO}_3$ was used. The total amount of impurities did not exceed 0.001 %.		
The acid concentration in liquid and solid phases was determined by titration with standard NaOH solution, and the iodate concentration determined by titration with thiosulfate solution.			Iodic acid was prepared as described in ref.(1).		
The composition of the solid phase was determined by Schreinemakers' method of residues and checked by X-ray diffraction.			<b>ESTIMATED ERROR:</b>		
			Nothing specified.

<b>AUXILIARY INFORMATION</b>																																																																															
<b>METHOD/APPARATUS/PROCEDURE:</b> The method employs the fact that the solubility of $\text{LiIO}_3$ in water decreases as the temperature is increased. A nearly saturated solution was prepared in a closed vessel at room temperature and placed in a thermostat. On heating to higher temperatures lithium iodate precipitated. The solution was kept at the higher experimental temperature for a few hours until the composition was constant. The analysis involved hydrogen ion concentration by NaOH titration, and iodate ion concentration determinations by iodometry as described in ref (1).	<b>SOURCE AND PURITY OF MATERIALS:</b> Nothing specified.  <b>ESTIMATED ERROR:</b> Soly: precision $\pm 1\%$ or better. Temp: nothing specified.  <b>REFERENCES:</b> 1. Ricci, J.; Amron, I. J. <i>Am. Chem. Soc.</i> 1953, 73, 3613

<b>AUXILIARY INFORMATION</b>																																																																																																																																																																											
<b>METHOD/APPARATUS/PROCEDURE:</b> The $\text{LiIO}_3$ - $\text{KIO}_3$ - $\text{HIO}_3$ - $\text{H}_2\text{O}$ system was studied by the isothermal method. Equilibrium in the system was established in 14 days except for viscous solutions when equilibrium was established after one month. In sampling, the solutions were centrifuged, then thermostated, and only after this procedure was liquid phase separated from the solid. The liquid and solid phases were analyzed for $\text{K}^+$ gravimetrically by precipitation with sodium tetraphenylborate in acetic acid, $\text{Li}^+$ by flame photometry, $\text{IO}_3^-$ by iodometric titration, and $\text{H}^+$ by titration with standard alkali. The compositions of the solid phases were determined by Schreinemakers' method of residues.		<b>SOURCE AND PURITY OF MATERIALS:</b> "Chemically pure" grade $\text{KIO}_3$ and $\text{HIO}_3$ were used. Lithium iodate was made from $\text{HIO}_3$ and $\text{Li}_2\text{CO}_3$ .																																																																																																																																																																									
		<b>ESTIMATED ERROR:</b> Nothing specified.

AUXILIARY INFORMATION continued....						
<b>METHOD/APPARATUS/PROCEDURE:</b> The quaternary system $\text{LiIO}_3$ - $\text{Al}(\text{IO}_3)_3$ - $\text{HIO}_3$ - $\text{H}_2\text{O}$ was studied by the isothermal method. Equilibrium was established in 30-45 days. Aliquots of the liquid phases were analyzed for iodate by iodometric titration, for lithium by flame photometry, and for aluminum by complexometric titration. The iodic acid was determined by difference, but for the eutectic solution iodic acid was determined by titration with standard NaOH solution. The solid phases were identified by the method of residues, and by X-ray diffraction.		<b>SOURCE AND PURITY OF MATERIALS:</b> "Special purity" grade $\alpha$ - $\text{LiIO}_3$ and $\text{HIO}_3$ were recrystallized twice from aqueous solution. Aluminum iodate was prepared at 80-90°C by neutralization of a saturated solution of iodic acid with freshly precipitated aluminium hydroxide in equivalent amounts, cooling the solution to room temperature, and drying the salt. Found, mass %: Al 4.03; $\text{IO}_3$ 78.7; $\text{H}_2\text{O}$ 17.6. Calcd. for $\text{Al}(\text{IO}_3)_3 \cdot 6\text{H}_2\text{O}$ , mass %: Al 4.09; $\text{IO}_3$ 79.53; $\text{H}_2\text{O}$ 16.38.				
		<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm$ 0.1 K.

<b>VARIABLES:</b>  Concentration of ethanol at 298 K	<b>PREPARED BY:</b>  Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b>  Numerical solubility data for the ternary $\text{LiIO}_3$ -ethanol- $\text{H}_2\text{O}$ system were not given in the original paper. The phase diagram shown here was the only data reported. <div style="text-align: center;"> </div> <p>As the alcohol concentration in the solution is increased, there is a marked decrease in the solubility of lithium iodate. Thus, the solubility of lithium iodate is reduced to one-half in a solution with 15.5 mass % <math>\text{C}_2\text{H}_5\text{OH}</math>. A further increase in alcohol concentration leads to a less pronounced decrease in the solubility of <math>\text{LiIO}_3</math>. The solubility of lithium iodate in anhydrous ethanol is <math>&lt;0.01</math> mass %.</p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b>  The solubility of lithium iodate-ethanol-water system was investigated by the isothermal method. Equilibrium was established in 5-6 days. The authors do report that saturated solutions were analyzed for $\text{LiIO}_3$ (i.e. presumably for both $\text{Li}^+$ and $\text{IO}_3^-$ , compiler), but no details were given.	<b>SOURCE AND PURITY OF MATERIALS:</b>  "Special purity" grade lithium iodate was used. Ethanol was purified and dried by a published method (ref 1).  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.  <b>REFERENCES:</b> 1. <b>AUXILIARY INFORMATION</b>																
<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions were prepared in an Erlenmeyer flask by mixing the dried acetone with an excess of iodate for two hours. The solution was constantly stirred by bubbling dry air (air was dried by passing it through $\text{CaCl}_2$ while pumping it into the solution). Air going out from the flask after bubbling in the solution carried some acetone vapor during this operation. The solution temperature was kept constant by immersing the flask in a constant temperature water bath. After two hours, the air exit was closed. The resulting pressure forced the saturated solution from the Erlenmeyer through a tube filled with cotton (which acted as a filter), and was collected in a small flask. This flask was stoppered and weighed. The iodate contained in the sample was weighed after complete evaporation of acetone.	<b>SOURCE AND PURITY OF MATERIALS:</b> Commercial redistilled acetone. This acetone was then dehydrated three times by leaving it in contact with calcium chloride for forty eight hours each time. Fresh $\text{CaCl}_2$ was used in each operation. Finally, the dehydrated acetone was distilled at 56.3°C.  Source and purity of $\text{LiIO}_3$ not specified.															
<b>ESTIMATED ERROR:</b> Nothing specified.

<p>COMPONENTS:</p> <p>(1) Sodium iodate; NaIO<sub>3</sub>; [7681-55-2]</p> <p>(2) Water; H<sub>2</sub>O; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto Niigata University Niigata, Japan and Mark Salomon US Army ET &amp; DL Fort Monmouth, NJ, USA</p> <p style="text-align: right;">January 1985</p>								
<p>CRITICAL EVALUATION: THE BINARY SYSTEM</p> <p>Data for the solubility of NaIO<sub>3</sub> in water have been reported in 19 publications (1-19). Note that the compilation for reference (16) is given in the LiIO<sub>3</sub> chapter, and the compilation for reference (18) is given in the previous volume on alkaline earth metal halates (Vol. 14 of the IUPAC SOLUBILITY DATA SERIES, ref. (20)). Several authors appear to report the same solubilities in two or more publications, and these values have been treated as a single independent measurement (details are given in the text below). Many of the studies deal with ternary systems, and the solubility in the binary system was given as one point on a phase diagram. Depending upon temperature and composition, three solid phases have been identified in the binary system:</p> <table style="width: 100%; border: none;"> <tr> <td style="text-align: center;">NaIO<sub>3</sub>·5H<sub>2</sub>O</td> <td style="text-align: center;">[17250-90-7]</td> <td style="text-align: center;">NaIO<sub>3</sub></td> <td style="text-align: center;">[7681-55-2]</td> </tr> <tr> <td style="text-align: center;">NaIO<sub>3</sub>H<sub>2</sub>O</td> <td style="text-align: center;">[22451-04-7]</td> <td></td> <td></td> </tr> </table> <p>The temperature dependence of the solubility of NaIO<sub>3</sub> in pure water has been studied by Foote and Vance (2) over the range 273.2 - 363.5 K, and by Cornec and Spack (8) over the range 273.2 - 373.2 K. Both studies reported the existence of the three solid phases, and transition temperatures were determined graphically. Foote and Vance (2) reported the pentahydrate → monohydrate transition temperature as 293.1 K, and the monohydrate → anhydrate transition temperature as 346.6 K. These two temperatures are in good agreement with those of Cornec and Spack, but they differ from the evaluators' recommended values evaluated graphically below (293.2 K and 347.4 K). The monohydrate → pentahydrate transition temperature of 295 K reported by Hill and Donovan (6) appears too high and should be rejected.</p> <p>The solubility data reported by Foote and Vance (2) and by Cornec and Spack (8) are plotted as a function of temperature in Figure 1.</p> <p>In evaluating the solubility data for the binary system, each polytherm in the phase diagram was separately fitted to a smoothing equation. For mole fraction solubilities the following smoothing equation was used,</p> $Y_x = A/(T/K) + B \ln(T/K) + C + D(T/K) \quad [1]$ <p>and for molalities, the following smoothing equation was used</p> $Y_m = A/(T/K) + B \ln(T/K) + C \quad [2]$ <p>The complex Y terms in eqs. [1] and [2] are defined in the PREFACE to this volume and in the critical evaluations for LiClO<sub>3</sub> and RbClO<sub>3</sub>. Solubility data were rejected when the difference between the calculated and observed mole fraction solubilities exceeded twice the standard error of estimate: i.e. when</p> $\text{abs} [\chi_{\text{obsd}} - \chi_{\text{calcd}}] > 2\sigma_x \quad [3]$ <p><u>Polytherm For NaIO<sub>3</sub>·5H<sub>2</sub>O As The Solid Phase</u></p> <p>A summary of the experimental data is given in Table 1. The identical solubility at 273.2 K reported by Foote and Vance in three publications (2, 3, 10) was treated as one independent measurement, and therefore 17 independent data points were used in the smoothing equations. No data points were rejected. Mole fraction solubilities were fitted to</p> $Y_x = -150902/(T/K) - 1053.291 \ln(T/K) + 1.95591(T/K)$ $\sigma_y = 0.011 \quad \sigma_x = 2.9 \times 10^{-5}$		NaIO <sub>3</sub> ·5H <sub>2</sub> O	[17250-90-7]	NaIO <sub>3</sub>	[7681-55-2]	NaIO <sub>3</sub> H <sub>2</sub> O	[22451-04-7]

CRITICAL EVALUATION:			
For mol/kg solubilities, the following smoothed relation was obtained:			
$Y_m = 4070.9/(T/K) + 31.360 \ln(T/K) - 191.440$			
$\sigma_y = 0.0061 \quad \sigma_m = 0.0019$			
Solubilities calculated from these equations are designated as recommended, and recommended fraction solubilities are given in Table 4 at the end of this evaluation.

<u>Polytherm For NaIO<sub>3</sub>.H<sub>2</sub>O As The Solid Phase</u>			
Table 2 lists the solubilities at various temperatures given in 52 references, and which we have treated as representing 35 independent measurements. In fitting these 35 solubility values to the smoothing equations, five points were rejected as indicated in Table 2. The remaining 30 solubility values yielded the following:			
$Y_x = 3187.5/(T/K) + 45.366 \ln(T/K) - 254.20 - 0.07121(T/K)$			
$\sigma_y = 0.012 \quad \sigma_x = 7.2 \times 10^{-5}$			
For mol/kg solubilities, the smoothed data are given by			
$Y_m = -1620.6/(T/K) + 1.394 \ln(T/K) - 2.496$			
$\sigma_y = 0.006 \quad \sigma_m = 0.004$

## CRITICAL EVALUATION:

## TERNARY SYSTEMS

Many studies for solubilities in ternary aqueous systems with two saturating components have been reported. Summaries of these studies are given in Tables 5-8.

The System With Iodic Acid.

This system was studied by Meerburg (1) at 303 K and Shibuya and Watanabe (14) at 288 K. The compositions of the solid phase obtained are as follows:

Many solubility studies at 303 K reported the solid phase of NaIO<sub>3</sub>·H<sub>2</sub>O, but did not report NaIO<sub>3</sub>·1.5H<sub>2</sub>O. Solid HIO<sub>3</sub> was not reported in (14). The compositions of the double salts appear doubtful, and the evaluator is of the opinion that additional studies are required to confirm the compositions of the various solid phases.

System With Other Iodates

Solubilities in ternary aqueous systems containing sodium iodate with other iodates have been reported in 6 publications (7, 15-19) (see Table 5). No double salts were found in these systems as all are of the simple eutonic type. The sodium salt in the solid phase at 278 K is the pentahydrate, and that at 298 and 323 K is the monohydrate.

Table 5. Summary of solubility studies of ternary systems with sodium iodate and other iodates

Ternary System	T/K	Solid Phase	Reference

System With Sodium Halides

Aqueous ternary systems containing sodium iodate with a sodium halide have been studied in 3 publications (3, 9, 11) (see Table 6). For NaIO<sub>3</sub> - NaBr - H<sub>2</sub>O and NaIO<sub>3</sub> - NaCl - H<sub>2</sub>O, double salts were found, but in the NaIO<sub>3</sub> - NaI - H<sub>2</sub>O system the formation of double salts was not reported. The compositions of the double salts are given in Table 6.

The System With Sodium Nitrate

Solubilities in this ternary system have been reported in 3 publications (4, 6, 8) (see Table 7). Foote and Vance (4) and Hill and Donovan's (6) studies covered a wide range of compositions for each temperature investigated. Below 281 K, the double salt  $2\text{NaIO}_3 \cdot 3\text{NaNO}_3 \cdot 15\text{H}_2\text{O}$  was reported in (4, 6, 8), and sodium iodate in the solid phase is the pentahydrate. Hill and Donovan stated that their results at 278 K confirmed those of Foote and Vance, with a somewhat better agreement between calculated and experimental results for the double salt  $2\text{NaIO}_3 \cdot 3\text{NaNO}_3 \cdot 15\text{H}_2\text{O}$ . Above 283 K, no double salts form.

Systems With Other Sodium Salts

Solubilities in the NaIO<sub>3</sub>-Na<sub>2</sub>SO<sub>4</sub>-H<sub>2</sub>O system at 273, 303, 308 and 323 K have been reported by Foote and Vance (5). Double salts were found only at 303, 308 and 323 K. The compositions of double salts are given in Table 8. Ternary systems NaIO<sub>3</sub>-Na<sub>2</sub>CO<sub>3</sub>-H<sub>2</sub>O, NaIO<sub>3</sub>-NaClO<sub>3</sub>-H<sub>2</sub>O and NaIO<sub>3</sub>-Na<sub>2</sub>MoO<sub>4</sub>-H<sub>2</sub>O have been reported by Foote and Vance (10), Ricci (5) and Shklovskaya's group (13), respectively, and double salts were not found (see Table 8).

Table 8. Summary of the solubility of NaIO<sub>3</sub> in the presence of several sodium salts

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Binary mixts agitated in a thermostat for 4-6 hours. Equil was approached from both the supersatd and undersatd solutions, and analysis was determined in duplicate. Iodate was detd by adding excess KI, acidifying with H <sub>2</sub> SO <sub>4</sub> , and titrating with standard sodium thiosulfate sln.  Solid phases analyzed as follows: Below 19.85 °C where the pentahydrate is stable, the solid was separated from sln in a cold room and quickly dried, and presumably analyzed for iodate. Over the temp range where the monohydrate is stable, numerous analyses were made of the solid phase, presumably by a method similar to that described above. For the region where the anhydr salt is stable, the solid was separated, washed quickly with alcohol, and dried between filter paper.			<b>SOURCE AND PURITY OF MATERIALS:</b> Sodium iodate was a very pure commercial product having a composition closely approximating the monohydrate. The salt was recrystallized before use.		
			<b>ESTIMATED ERROR:</b> Nothing specified.		

<b>COMPONENTS:</b> (1) Sodium iodate; $\text{NaIO}_3$ ; [7681-55-2] (2) Water; $\text{H}_2\text{O}$ ; [7732-18-5]		<b>ORIGINAL MEASUREMENTS:</b> Hill, A.E.; Donovan, J.E. J. Am. Chem. Soc. <u>1931</u> , 53, 934-41.

<sup>a</sup> A = $\text{NaIO}_3 \cdot 5\text{H}_2\text{O}$ ;      B = $\text{NaIO}_3 \cdot \text{H}_2\text{O}$					
<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Recrystallized and dehydrated excess sodium iodate was placed in 40 ml glass-stoppered Pyrex test-tubes with water and rotated in a water thermostat for about two weeks. Equilibrium was reached from super-saturation. After the tubes were allowed to settle, samples were withdrawn into a calibrated pipet fitted with a small cotton filter. One sample was weighed and evaporated in a platinum dish to constant weight at $110^\circ\text{C}$ . From this the water content of the saturated solution was determined. To determine the $\text{NaIO}_3$ content, a second weighed sample was treated with KI and sulfuric acid and titrated with sodium thiosulfate. The densities of the solutions were also determined.			<b>SOURCE AND PURITY OF MATERIALS:</b> "Good grade" sodium iodate was purified by recrystallization. No other information given.		
			<b>ESTIMATED ERROR:</b> Soly: the error for the analysis of iodate by iodometry was within 0.2 %. Temp: precision $\pm 0.05$ K.

<b>AUXILIARY INFORMATION</b>																																																																																																																	
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubilities determined isothermally by stirring complexes of known compositions in Pyrex tubes, and sampling the equilibrated solutions by means of calibrated pipets fitted with filtering tips. Total solids were determined by evaporation of an aliquot of saturated solution and drying to constant weight at 125°C.  The iodate content in the saturated solution was determined iodometrically. A large excess of acid (HCl) was necessary to obtain the correct end-point within the short titration time in the presence of the molybdate.	<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade sodium molybdate dihydrate completely dehydrated by heating to 180°C, and stored at 150°C. The purity of this anhydrous salt was found to be 100.0%. C.p. grade sodium iodate was found to be pure within 1/1000.																																																																																																																
<b>ESTIMATED ERROR:</b> Soly: the accuracy of titrations was within 0.1%. Temp: precision ± 0.04 K.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b>

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Sodium iodate, sodium carbonate and water were placed in glass stoppered bottles and rotated in a thermostat. Twenty-four hours were allowed for the attainment of equilibrium at which time samples of the solution were drawn off through glass wool filters for analysis. Sodium iodate content was determined by adding excess KI, acidifying with sulfuric acid, and titrating the liberated iodine with thio-sulfate solution. Sodium carbonate was detd in a second sample by titration with HCl using methyl orange indicator. In these carbonate titrations, a constant light source was used and the end point was compared with a standard made by saturating water containing a few drops of methyl orange with carbon dioxide. The composition of the dry solid phase was determined by the method of Schreinemakers.			<b>SOURCE AND PURITY OF MATERIALS:</b> The authors only state that sodium iodate and carbonate were purified by customary methods.		
			<b>ESTIMATED ERROR:</b> Nothing specified.		
			<b>REFERENCES:</b>		

## COMPONENTS:

- (1) Sodium carbonate;  $\text{Na}_2\text{CO}_3$ ; [4917-19-8]  
 (2) Sodium iodate;  $\text{NaIO}_3$ ; [7681-55-2]  
 (3) Water;  $\text{H}_2\text{O}$ ; [7732-18-5]

## ORIGINAL MEASUREMENTS:

Foote, H.W.; Vance, J.E.  
*Am. J. Sci.* 1933, 25, 499-502.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Sodium iodate, sodium nitrate and water were placed in glass stoppered bottles and rotated in a thermostat. Samples of the solution were drawn off through glass wool filters. The iodate content was determined by adding KI to the solution, acidifying with sulfuric acid, and titrating the free iodine with sodium thiosulfate solution. The nitrate content was calculated from the iodate concentration and the total mass of salts in solution. Water was found by difference. The solid phases were analyzed as wet residues after largely freeing them from water by pressing between filter papers. The composition of the dry residue was determined by Schreinemakers' method.			<b>SOURCE AND PURITY OF MATERIALS:</b> Sodium iodate and nitrate used were c.p. products which were recrystallized once.		
			<b>ESTIMATED ERROR:</b> Nothing specified.

## AUXILIARY INFORMATION

## METHOD/APPARATUS/PROCEDURE:

The details of procedure were not given. The iodate content was determined by titration with thiosulfate solution. The total solids were determined by evaporation of the solution at about 140°C. The compiler assumes that the concentration of the nitrate was determined by difference.

## SOURCE AND PURITY OF MATERIALS:

Sodium iodate used was purchased as a "pure chemical". The salt was recrystallized four times. The product obtained was the monohydrate.

## ESTIMATED ERROR:

Nothing specified.

<b>AUXILIARY INFORMATION</b>							
<b>METHOD/APPARATUS/PROCEDURE:</b> For sodium iodate-sodium nitrate-water system, weighed quantities of these salts were treated with weighed amounts of water in Pyrex test-tubes. The tubes were slowly rotated in a water-thermostat at the desired temperature for about two weeks. After the slns were allowed to settle, samples were withdrawn into a calibrated pipet fitted with a small cotton filter. One sample was weighed and evaporated in a platinum dish to constant weight at $110^\circ\text{C}$ . From this the water content of the saturated solution was determined. To determine the $\text{NaIO}_3$ content, a second weighed sample was treated with KI and $\text{H}_2\text{SO}_4$ , and titrated with $\text{Na}_2\text{S}_2\text{O}_3$ . The sodium nitrate content was obtained by difference.				<b>SOURCE AND PURITY OF MATERIALS:</b> "Good grade" sodium iodate and sodium nitrate were purified by recrystallization.			
				<b>ESTIMATED ERROR:</b> Soly: the error for the analysis of iodate by iodometry was within 0.2 %. Temp: precision $\pm 0.05$ K.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Sodium iodate, sodium sulfate and water were placed in glass stoppered bottles and the bottles rotated in a thermostat. Two weeks were allowed for the attainment of equilibrium except in the case of the solubility isotherm at 25°C and 50°C where a minimum of 48 hours were allowed. Samples of the solution were drawn off through glass wool filters for analysis. The composition of the dry solid phases were determined by the method of Schreinemakers'. Sodium iodate in the liquid and solid phases was determined by adding potassium iodide to the samples, acidifying with sulfuric acid, and titrating the liberated iodine with thiosulfate solution. The sulfate content was calculated from the iodate concentration and the mass of total salts. Water was found by difference.			<b>SOURCE AND PURITY OF MATERIALS:</b> The authors only stated that sodium iodate and sodium sulfate were purified by customary methods.		
			<b>ESTIMATED ERROR:</b> Nothing specified.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>		
Sodium iodate, sodium chloride and water were placed in glass stoppered bottles, and the bottles rotated in a thermostat for 24 hours. Samples of the solution were drawn off through glass wool filters. The iodate content was determined by adding KI to the solution, acidifying with sulfuric acid, and titrating the free iodine with sodium thio-sulfate solution. The chloride content was calculated from the IO <sub>3</sub> concentration and the total weight of salt in solution. Water was found by difference.			The source of NaCl and NaIO <sub>3</sub> was not given in the original paper. The authors state that the salts were purified by usual methods, however, the details of purification were not reported.		
The solid phases were analyzed as wet residues after largely freeing them from water by pressing between filter papers. The composition of the dry residue was then determined by Schreinemakers' method.			<b>ESTIMATED ERROR:</b>		
			Nothing specified.

<b>AUXILIARY INFORMATION</b>							
<b>METHOD/APPARATUS/PROCEDURE:</b>				<b>SOURCE AND PURITY OF MATERIALS:</b>			
Ternary complexes were stirred for 1-2 weeks at temperatures below 40°C, and for 2-4 days at higher temperatures (40-50°C). This length of time allowed for the attainment of equilibrium as determined in several cases by successive analysis of the solutions. Care had to be taken to seed each complex with the expected stable solid phase whenever possible, and to break up the caked hydrates which sometimes formed on mixing the salt with water in the preparation of the complexes. In one sample of the saturated solution, the iodate was determined by titration with standard thiosulfate solution. In another sample, the total solid was determined by evaporation of the solution at 100°C followed by one to two hours at 350°C. The concentration of the bromide was then determined by difference.				The salts used were prepared by recrystallization of the best available c.p. material which, in the case of the bromide, usually contained from 0.5 to 1.0 % chloride. The purified salts were dried to the anhydrous state and stored at 100°C.

<b>AUXILIARY INFORMATION</b>							
<b>METHOD/APPARATUS/PROCEDURE:</b>				<b>SOURCE AND PURITY OF MATERIALS:</b>			
The salts were weighed into stoppered Pyrex tubes with weighed amounts of water and stirred by mechanical inversion in a thermostat for 4-7 days. Small samples of the saturated solution were withdrawn by suction through a filter into a pipet. One sample was dried to constant weight in the oven, while a second was analyzed for iodate. Iodate was determined by iodometry, thio-sulfate solution being used in the titration. The water was determined gravimetrically (after evaporation).				Sodium iodate was recrystallized from water and dehydrated in an electric oven at 100°C. Sodium iodide (c.p. grade) was purified by recrystallization and dried in an electric oven at 100°C.			
				<b>ESTIMATED ERROR:</b>			
				Soly: precision of the analyses about 0.3 %. Temp: not given.

<b>AUXILIARY INFORMATION</b>																																																																											
<b>METHOD/APPARATUS/PROCEDURE:</b>	<b>SOURCE AND PURITY OF MATERIALS:</b>																																																																										
The isothermal method was used. Equilibrium was reached in 25-30 days. Samples of the coexisting phases were analyzed for sodium by emission spectrometry. The hafnium content was determined potentiometrically using Arsenazo III after reducing the iodate ion with hydroxylamine.	C.p. grade $\text{NaIO}_3 \cdot \text{H}_2\text{O}$ was recrystallized from distilled water. Hafnium iodate was prepared by the action of aqueous iodic acid solution on freshly precipitated hafnium hydroxide (ref 1.)																																																																										
The composition in the solid phase was determined by the method of residues and the result was checked by X-ray analysis.	<b>ESTIMATED ERROR:</b> Soly: within 1-3 % rel. % (emission spectrometry for Na). Temp: precision $\pm 0.1$ K.

<p><sup>a</sup> A = NaIO<sub>3</sub>·1.5H<sub>2</sub>O; B = HIO<sub>3</sub>; C = Na<sub>2</sub>O·2I<sub>2</sub>O<sub>5</sub>; D = NaIO<sub>3</sub>·2HIO<sub>3</sub>.</p> <p><sup>b</sup> For binary systems the compiler computes the following:            soly of HIO<sub>3</sub> = 18.71 mol kg<sup>-1</sup>            soly of NaIO<sub>3</sub> = 0.522 mol kg<sup>-1</sup></p>																																																																																																																														
METHOD/APPARATUS/PROCEDURE:	SOURCE AND PURITY OF MATERIALS																																																																																																																													
A mixture of NaIO <sub>3</sub> , HIO <sub>3</sub> and water was placed in a bottle and the bottle agitated in a thermostat for a week or more at a desired temperature. Equilibrium was established from supersaturation.	Nothing specified.																																																																																																																													
The iodic acid and sodium iodate contents were detd as follows: an excess of KI was added to an aliquot of satd sln, and the HIO <sub>3</sub> content detd by titration of the iodine liberated with standard sodium thiosulfate. Dil sulfuric acid was then added to the solution and the iodine liberated was again titrated with sodium thiosulfate to obtain the total iodate concentration.	ESTIMATED ERROR: Nothing specified.																																																																																																																													
The sodium iodate concentration was calculated from the difference between the second and the first titration.  Composition of solid phases determined by the method of residues.	COMMENTS AND/OR ADDITIONAL DATA:  (mass % units)

<sup>a</sup> A = $\text{NaIO}_3 \cdot 5\text{H}_2\text{O}$ ; B = $2\text{NaIO}_3 \cdot \text{I}_2\text{O}_5$ ; C = $\text{NaIO}_3 \cdot \text{I}_2\text{O}_5$																																																																																																					
<sup>b</sup> For the binary system the compiler computes the following: $\text{Soly of NaIO}_3 = 0.315 \text{ mol kg}^{-1}$																																																																																																					
<b>AUXILLARY INFORMATION</b>																																																																																																					
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method by three techniques depending upon mole fraction, $x$ , of $\text{HIO}_3$ . (1) For $x = 0$ to 0.574. Excess acid added to $\text{NaIO}_3$ sln and stirred for 5 h. (2) For $x = 0.574$ to 0.646. Aq acid sln for $x = 0.638$ was cooled to obtain $\text{HIO}_3$ crystals. The crystals were added to an unsatd sln of $\text{NaIO}_3$ , and the mixture was stirred for a long time. (3) $x = 0.646$ to 1.0. Method essentially identical to (2) except that the acid crystals pptd from a sln where $x = 0.883$ , and stirring time was stated as 48 h. After equil was established and the slns allowed to settle, aliquots of satd sln were withdrawn with a pipet and weighed. The densities of the satd slns were detd. The total iodate concn was detd iodometrically, and the $\text{HIO}_3$ detd by acid-base titrn. Sodium was detd by difference. The composition of the solid phase was detd as follows: chem analyses were used to detn the acid and $\text{NaIO}_3$ contents, and thermogravimetry and NMR were used to detn the water content.	<b>SOURCE AND PURITY OF MATERIALS:</b> Sodium iodate was recryst three times from an aqueous sln prepd by electrolytic oxidation of iodine in alkaline sln. Iodic acid was prepd by ion exchange as follows: aq $\text{NaIO}_3$ sln was passed through a column of $\text{H}^+$ -resin (Amberlite IR 120), and the eluate was concentrated to about 30 % acid content by evaporation. The acid content was detd by acid-base titration.																																																																																																				
<b>ESTIMATED ERROR:</b> Soly: rel error probably $\pm 0.2\%$ (compilers). Temp: precision $\pm 0.05$ K.

<p>COMPONENTS:</p> <p>(1) Potassium iodate; <math>KIO_3</math>; [7758-05-6]</p> <p>(2) Water; <math>H_2O</math>; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto Niigata University Niigata, Japan and Mark Salomon US Army ET &amp; DL Fort Monmouth, NJ, USA</p> <p style="text-align: right;">June, 1986</p>
<p>CRITICAL EVALUATION:</p> <p style="text-align: center;">THE BINARY SYSTEM</p> <p>Solubility data for <math>KIO_3</math> in pure water have been reported in 30 publications (1-28, 35, 36). A summary of the solubility data over the temperature range 273-373 K is given in Table 1. Note that the data from references (15, 16, 20 and 31) have been compiled in the <math>LiIO_3</math> chapter, and the data in reference (3) have been compiled in the <math>NaIO_3</math> chapter. With the exception of the high temperature study of Benrath et al. (7) which employed the synthetic method, all other studies are based on the isothermal method. From Table 1 it is seen that a number of authors reported identical solubilities in more than one publication, and the evaluators have therefore treated these results as one independent measurement. Thus, at 298.2 K, the data in (3, 8, 10) have been treated as one independent solubility value as have the data reported in (17, 19, 23), and at 323.2 K in (18, 21, 26). Most authors reported the solid phase over the temperature range of 278-323 K as the anhydrous salt, and although Breusov et al. (11) and Benrath et al. (7) did not report the nature of the solid phases over the temperature range of 273-573 K, it probably is the anhydrous salt in all cases.</p> <p>In fitting the solubility data to the two smoothing equations, a number of data points were rejected as the differences in smoothed (calculated) solubilities differed from the experimental values by more than <math>2\sigma</math> (where <math>\sigma</math> is the standard error of estimate). The rejected data are referenced in Table 1, and it should be noted that the results of Wright (36) are so divergent from all other data that one must carefully question whether his results for ethanol-water mixtures are of any practical value.</p> <p>Thirty-two data points over the temperature range 273-373 K (see Table 1) were fitted to the smoothing equations with the following results:</p> $Y_x = -20587.2/(T/K) - 92.129 \ln(T/K) + 549.07 + 0.12250(T/K)$ $\sigma_y = 0.013 \qquad \sigma_x = 4.9 \times 10^{-5}$ <p>and</p> $Y_m = -4037.0/(T/K) - 6.671 \ln(T/K) + 51.547$ $\sigma_y = 0.0079 \qquad \sigma_m = 0.0047$ <p>Table 2 lists the solubilities calculated from these two smoothing equations, and the smoothed solubilities are designated as <i>recommended</i> solubilities.</p> <p>Benrath's data (7) over the temperature range of 390-573 K were treated separately, and the following smoothing equations were obtained:</p> $Y_x = -9532/(T/K) - 30.702 \ln(T/K) + 188.09 + 0.03523(T/K)$ $\sigma_y = 0.024 \qquad \sigma_x = 8.3 \times 10^{-4}$ <p>and</p> $Y_m = 298.8/(T/K) + 2.888 \ln(T/K) - 17.21$ $\sigma_y = 0.015 \qquad \sigma_m = 0.090$ <p>Smoothed solubilities based on Benrath's data are given in Table 3, and are designated as <i>tentative</i> solubilities.</p>

## CRITICAL EVALUATION:

## TERNARY SYSTEMS

## 1. One Saturating Component

Ricci and Nesse (28) measured solubilities of potassium iodate in mixtures of water and 1,4-dioxane at 298 K over the complete range of concentration from 0 to 100 % dioxane at intervals of 10 % by mass. The measurements cover a dielectric constant range from 2.10 to 78.50. The solubility of potassium iodate decreases with increasing dioxane concentration, that is, the solubility decreases with decreasing dielectric constant of the solvent mixture.

Bronsted (29) measured solubilities of potassium iodate in aqueous potassium hydroxide solutions at 298 K over the potassium hydroxide concentration range from 4.71 to 15.02 mol  $dm^{-3}$ . The temperature dependence of the solubility showed a minimum near the hydroxide concentration of 12 mol  $dm^{-3}$ .

## 2. Two Saturating Components

Summaries of solubilities in aqueous ternary systems with 2 saturating components are given in Tables 4-6.

The System With Iodic Acid. This system was studied by Meerburg (1) at 303 K and by Smith (9) at 278, 298 and 303 K. Two double salts  $KIO_3 \cdot HIIO_3$  and  $KIO_3 \cdot 2HIIO_3$  are found in this system.

Systems With The Other Alkali Metal Iodates. Solubility studies of ternary systems containing potassium iodate and other alkali iodates have been reported in 5 publications (2, 12, 13, 15, 16) (see Table 4). The two ternary systems  $KIO_3$ - $NaIO_3$ - $H_2O$  are of the simple eutonic type, and no double salts form. The sodium salt in the solid phase at 278 K is the pentahydrate, and that at 298 and 323 K is the monohydrate. The solubility for the ternary  $KIO_3$ - $LiIO_3$ - $H_2O$  system has been reported in 2 publications (15, 16). The double salt  $KIO_3 \cdot 2LiIO_3$  was formed.

Table 4. Summary of solubility studies on ternary systems with potassium iodate and other alkali metal iodates

Ternary system	T/K	Solid phase
$KIO_3 - LiIO_3 - H_2O$	298	$KIO_3$ , $LiIO_3$ , $KIO_3 \cdot 2LiIO_3$
$KIO_3 - LiIO_3 - H_2O$	323	$KIO_3$ , $LiIO_3$ , $KIO_3 \cdot 2LiIO_3$
$KIO_3 - NaIO_3 - H_2O$	278	$KIO_3$ , $NaIO_3 \cdot 5H_2O$
$KIO_3 - NaIO_3 - H_2O$	298, 323	$KIO_3$ , $NaIO_3 \cdot H_2O$
$KIO_3 - RbIO_3 - H_2O$	298	Not given
$KIO_3 - CsIO_3 - H_2O$	298	$KIO_3$ , $CsIO_3$

Systems With Alkaline Earth Metal Iodates. The ternary  $KIO_3$ - $Mg(IO_3)_2$ - $H_2O$  system at 323 K has been studied by Vinogradov and Karataeva (25). The dominant feature in this system is the existence of the double salt  $2KIO_3 \cdot Mg(IO_3)_2 \cdot 4H_2O$ . The ternary  $KIO_3$ - $Ba(IO_3)_2$ - $H_2O$  system was studied by Azarova and Vinogradov (24) and is of the simple eutonic type: no double salts were formed. Ternary systems with calcium and strontium iodate have not been studied.

**CRITICAL EVALUATION:**

Systems With Transition Metal and Rare Earth Iodates. Solubilities in ternary systems with transition metal iodates have been reported in 4 publications (18, 21, 22, 26), and are summarized in Table 5.

Table 5. Summary of solubility studies on ternary systems with  $KIO_3$  and transition metal iodates

Ternary system	T/K	Solid phase	Reference
$KIO_3 - Mn(IO_3)_2 - H_2O$	323	$KIO_3, Mn(IO_3)_2 \cdot K_2[Mn(IO_3)_4(H_2O)_2]$	21
$KIO_3 - Co(IO_3)_2 - H_2O$	323	$KIO_3, Co(IO_3)_2 \cdot 2H_2O, 2KIO_3 \cdot Co(IO_3)_2 \cdot 2H_2O$	18
$KIO_3 - Ni(IO_3)_2 - H_2O$	323	$KIO_3 \cdot Ni(IO_3)_2 \cdot 2H_2O, K_2[Ni(IO_3)_2 \cdot (H_2O)_2]$	22
$KIO_3 - Cu(IO_3)_2 - H_2O$	323	$KIO_3, Cu(IO_3)_2 \cdot 2H_2O, 2KIO_3 \cdot Cu(IO_3)_2 \cdot 2H_2O$	26
$KIO_3 - Zn(IO_3)_2 - H_2O$	323	$KIO_3, Zn(IO_3)_2 \cdot 2H_2O, 2KIO_3 \cdot Zn(IO_3)_2 \cdot 2H_2O$	18

Double salts  $2KIO_3 \cdot Co(IO_3)_2 \cdot 2H_2O$  and  $KIO_3 \cdot Zn(IO_3)_2 \cdot 2H_2O$  were reported in (18) by Lepeshkov, Vinogradov and Karataeva. Further investigation of the double compounds by various physicochemical methods (21) suggest that the compounds are complexes with  $Co^{2+}$  or  $Zn^{2+}$  central ions in an octahedral environment of four  $IO_3^-$  ions and two water molecules. Vinogradov, Karataeva and Lepeshkov (26) reported that like the double compounds of potassium iodate with cobalt or zinc iodate, the double salt of potassium iodate and copper iodate is probably a complex with the following formula:  $K_2[Cu(IO_3)_4(H_2O)_2]$ . Therefore, the dominant feature in these systems is the existence of complex compounds with the general formula  $K_2[M(IO_3)_4 \cdot (H_2O)_2]$  ( $M = Mn, Co, Ni, Cu$  and  $Zn$ ), and the transition metal iodate in the solid phase is  $M(IO_3)_2 \cdot 2H_2O$  ( $M = Co, Ni, Cu$  and  $Zn$ ). Manganese iodate is the anhydrate.

The ternary  $KIO_3-Nd(IO_3)_3-H_2O$  system was studied by Tarasova, Vinogradov and Kudinov (23). The system is of the simple eutonic type, and no double salts form.

Although aluminum cannot be classified as a transition metal, this system is reviewed in this section. The ternary  $KIO_3-Al(IO_3)_3-H_2O$  system studied by Vinogradov and Tarasova (19) is eutonic, and no double compounds form.

System With Potassium Halides. Solubility studies for these ternary systems are summarized in Table 6. These systems are eutonic, and no double salts form.

Table 6. Summary of the ternary systems  
 $KIO_3 - Potassium\ halide - H_2O$

Ternary system	T/K	Solid phase	Reference
$KIO_3 - KCl - H_2O$	278, 298, 323	$KIO_3, KCl$	3
$KIO_3 - KBr - H_2O$	278, 298, 322	$KIO_3, KBr$	5
$KIO_3 - KI - H_2O$	298	$KIO_3, KI$	6

<p>COMPONENTS:</p> <p>(1) Potassium iodate; <math>KIO_3</math>; [7758-05-6]</p> <p>(2) Water; <math>H_2O</math>; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>Hiroshi Miyamoto Department of Chemistry Niigata University Niigata, Japan</p> <p style="text-align: right;">June, 1984</p>
<p>CRITICAL EVALUATION:</p> <p><u>System With The Other Potassium Salts.</u> The ternary system <math>KIO_3</math>-<math>K_2SO_4</math>-<math>H_2O</math> was studied by Hill and Ricci (3). At 278, 298 and 323 K, compound formation such as those which form in the corresponding sodium system (32) does not occur. The potassium system is thus of the simple eutonic type.</p> <p>The ternary system <math>KIO_3</math>-<math>KNO_3</math>-<math>H_2O</math> was studied by Hill and Brown (4). At 278, 298 and 323 K, no compound formation occurs which differs from the corresponding sodium salt systems (33, 34) where compound formation was observed.</p> <p>The ternary system <math>KIO_3</math>-<math>KClO_3</math>-<math>H_2O</math> was studied by Ricci (8). Neither compound formation nor solid solution were observed at the temperature studied.</p> <p>The ternary system <math>KIO_3</math>-<math>K_2MoO_4</math>-<math>H_2O</math> was studied by Ricci and Loprest (10). The results showed that the only solids are the pure anhydrous salts, and no double compounds form at 298 K.</p> <p><u>The System With Potassium Hydroxide.</u> Solubilities in the ternary <math>KIO_3</math>-<math>KOH</math>-<math>H_2O</math> system at 298 K have been studied by Leposhkov, Vinogradov and Tarasova (17). The phase diagram is of the simple eutonic type, and no double salts form.</p> <p style="text-align: center;">OTHER MULTICOMPONENT SYSTEMS</p> <p>The quaternary <math>KIO_3</math>-<math>KI</math>-<math>KOH</math>-<math>H_2O</math> system was studied by Malyshev, Kuz'menko, Novikov and Traul'ko (30) at 293, 333 and 353 K. The pH was adjusted to 13.8 with potassium hydroxide, and the authors stated that the solubility of potassium iodate in the alkaline medium is less than in the <math>KIO_3</math>-<math>KI</math>-<math>H_2O</math> ternary system. The compositions of the solid phase in equilibrium with the saturated solutions are <math>KIO_3</math> and <math>KI</math>.</p> <p>The quaternary system <math>KIO_3</math>-<math>LiIO_3</math>-<math>HIO_3</math>-<math>H_2O</math> has been studied by Azarova and Vinogradov (31) at 323 K. Three double salts, <math>KIO_3 \cdot 2LiIO_3</math>, <math>KIO_3 \cdot HIO_3</math> and <math>KIO_3 \cdot 2HIO_3</math> were formed, and lithium iodate and iodic acid formed a restricted range of solid solutions.</p> <p>The <math>KIO_3</math>-<math>LiIO_3</math>-<math>LiOH</math>-<math>KOH</math>-<math>H_2O</math> system at 298 K was studied by Vinogradov, Lepeshkov and Tarasova (20). Solubilities in the quaternary systems <math>KIO_3</math>-<math>LiIO_3</math>-<math>LiOH</math>-<math>H_2O</math> and <math>KIO_3</math>-<math>LiOH</math>-<math>KOH</math>-<math>H_2O</math> have been reported, but data for the five component system were not given. Solid phases found in this study are the pure components <math>LiIO_3</math>, <math>KIO_3</math>, <math>LiOH \cdot 2H_2O</math> and <math>KOH \cdot 2H_2O</math>. Solid solutions and the double salt <math>KIO_3 \cdot 2LiIO_3</math> were also found.</p> <p>REFERENCES:</p> <ol style="list-style-type: none"> <li>1. Meerburg, P. A. <i>Z. Anorg. Allg. <b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b> An excess potassium iodate was added to distilled water, and the mixture was shaken in a thermostat for about 10 hours. Equilibrium was established from both under-saturation and supersaturation.  The sample of the saturated solution was filtered off, and the solution was evaporated to dryness.		<b>SOURCE AND PURITY OF MATERIALS:</b> The purest commercial potassium iodate (Kahlbaum) was dissolved in distilled water, the solution was decanted three times to remove the impurity. The recrystallized potassium iodate was used for the solubility determination.		
		<b>ESTIMATED ERROR:</b> Soly: standard deviation is given in the table described above (compiler calculated) Temp: $\pm 0.02^\circ\text{C}$ (author)

<b>AUXILIARY INFORMATION</b>																																																							
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, soly detd in apparatus shown in figure. At equilibrium, the apparatus was tilted to allow satd sln to filter through connecting tube into weighed test tubes. The test tube was closed with a stopper, withdrawn, and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary soly vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat. The iodate content was determined iodometrically.	<b>SOURCE AND PURITY OF MATERIALS:</b> Results of analysis of $KIO_3$ :  $KIO_3$ content; 99.5 % Impurities, %, Rb 0.01; Cs 0.01; Na 0.005; $SO_4$ <0.01; Fe 0.005.																																																						
	<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.																																																						
	<b>REFERENCES:</b>																																																						

<b>COMPONENTS:</b> (1) Potassium iodate; $\text{KIO}_3$ ; [7758-05-6] (2) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Kolthoff, I.M.; Chantooni, M.K. <i>J. Phys. Chem.</i> <u>1973</u> , <i>77</i> , 523-6.
<b>VARIABLES:</b> T/K = 298	<b>PREPARED BY:</b> Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b> (1) Volumetric determination: The solubility of $\text{KIO}_3$ in water at 25°C was found to be $0.44 \text{ mol dm}^{-3}.$ (2) Potentiometric determination: The solubility product of $\text{KIO}_3$ in water is given: $pK_{s0} = 1.6 \text{ (authors)}$ $K_{s0} = 2.5 \times 10^{-2} \text{ mol}^2 \text{ dm}^{-6} \text{ (compiler)}$ The solubility product of $\text{KIO}_3$ was calculated from EMF data using the following equation: $E_{II} - E_I = 0.0591 [ pK_{s0}(\text{AgCl}) - pK_{s0}(\text{AgIO}_3) + pK_{s0}(\text{KIO}_3) + 2 \log[c(\text{KCl}) y_{\pm}(\text{KCl})]]$ where $E_I$ and $E_{II}$ are Emfs of Cell I and II, respectively. With a particular cation glass electrode $E_I = +0.051\text{V}$ and $E_{II} = +0.213\text{V}$ , which combined with the accepted values in water $pK_{s0}(\text{AgCl}) = 9.7$ , $pK_{s0}(\text{AgIO}_3) = 7.5$ , and the mean activity coefficient $y_{\pm}(\text{KCl})$ in 0.44 mol dm <sup>-3</sup> KCl solution of 0.65 (ref 1) yield the value for $pK_{s0}(\text{KIO}_3)$ .	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> (1) The solubility product of $\text{KIO}_3$ in water was estimated from the difference in emf of Cell I and II without liquid junction $\text{Ag, AgIO}_3/\text{salt}(c_1) / \text{K}(\text{gl}) \quad \text{I}$ $\text{Ag, AgCl}/\text{salt}(c_2) / \text{K}(\text{gl}) \quad \text{II}$ where $c_1$ is the concentration of $\text{IO}_3^-$ in saturated solution, and $c_2$ is the concentration of $\text{Cl}^-$ saturated in 0.44 mol dm <sup>-3</sup> $\text{KIO}_3$ solution. (2) The details of the isothermal method are not given. The iodate content was determined iodometrically.	<b>SOURCE AND PURITY OF MATERIALS:</b> $\text{KIO}_3$ was dried in <i>vacuo</i> at 70°C for 3 hours. Electrodes were prepared electrolytically (ref 2). <b>ESTIMATED ERROR:</b> The uncertainty in $pK_{s0}$ is $\pm 0.05$ . Temp: not given. <b>REFERENCES:</b> 1. <b>AUXILIARY INFORMATION</b>											
<b>METHOD/APPARATUS/PROCEDURE:</b> Saturated solutions of potassium iodate were prepared by the method of supersaturation. The saturated solutions were made by agitating the excess salt with water for one hour at 70°C and then for several hours in a 25°C bath. A sample of the clear solution was delivered in a weighing bottle, then the solvent evaporated and the residual pure salt was dried in vacuum at 100°C and weighed. Two duplicate determinations were made on the same sample of prepared solution.	<b>SOURCE AND PURITY OF MATERIALS:</b> Baker's analyzed "chemically pure" reagent grade $KIO_3$ was used. Heavy water was obtained from Norsk Hydro-Electrisk Kvalitets-faktieselskab in Oslo, and had a deuterium concentration of 99.7 mol %. The $D_2O$ content of the water mixture was determined by pycnometer both before and after each measurement. The mole percentage was calculated from the specific gravity at 25°C (ref 1).  <b>ESTIMATED ERROR:</b> Soly: precision better than 1 %. Temp: nothing specified.  <b>REFERENCES:</b> 1. Swift, E. Jr. <i>J. Am. Chem. Soc.</i> <u>1939, 61, 198.</u>

<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> The ternary mixtures were prepared by weight and were rotated in closed tubes for periods from one to two weeks (which time was shown by analysis of solutions to be sufficient for attainment of equilibrium). After the solid settled, samples were withdrawn with a pipet. The iodate content was determined iodometrically, and water was determined by evaporation and heating to constant weight. Potassium nitrate was determined by difference. The identity of the solid phases was established by the method of extrapolation of the tie-line passing through the points for the composition of the solutions and those of the original complexes.	<b>SOURCE AND PURITY OF MATERIALS:</b> The salts used were commercial products of good quality, and purified by recrystallization from water.  <b>ESTIMATED ERROR:</b> Soly: the compiler assumes that the precision of the solubility is within 0.3 %. Temp: not given.  <b>REFERENCES:</b>

	<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b> At 5°C and 25°C ternary complexes were stirred for one to two weeks, and for two to four days at 50°C. This length of time allowed for the attainment of equilibrium as determined in several cases by successive analyses. In one sample of the saturated solution, the iodate was determined by titration with standard thiosulfate solution. In another sample, the total solid was determined by evaporation of the solution at 100°C followed by one to two hours at 250°C. The concentration of the bromide was then determined by difference. For the determination of the composition of these solid phases, the method of algebraic extrapolation of tie-lines was used.				<b>SOURCE AND PURITY OF MATERIALS:</b> KIO <sub>3</sub> and KBr were prepared by recrystallization from the best available c.p. grade materials, which, in the case of the bromide, usually contained from 0.5 to 1.0 % chloride. The purified salts were dried to the anhydrous state.			
				<b>ESTIMATED ERROR:</b> Soly: average deviation in accuracy of analysis is 0.19 % (maximum 0.52 %). Temp: not given.

<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of KIO <sub>3</sub> , KI and H <sub>2</sub> O were stirred in a bath thermostatically controlled at 25°C for at least 2 days. KIO <sub>3</sub> was determined by adding excess KI, acidifying, and titrating the liberated iodine with standard sodium thiosulfate solution. The total solid was determined by evaporation at 100°C followed by 250°C. KI was then calculated by difference. The densities were calculated from the weight delivered by a volumetric pipet calibrated for delivery.				<b>SOURCE AND PURITY OF MATERIALS:</b> No information given.		
				<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision ± 0.02 K.

<b>AUXILIARY INFORMATION</b>																																																																	
<b>METHOD/APPARATUS/PROCEDURE:</b> The isothermal relief of supersaturation method was employed. The supersaturated slns were stirred for 7-8 hours. To det the comp of the coexisting phases, the authors used a method of indirect analysis. If p is the total mass of iodates, and b the total moles of iodates in it, then $p = bN_1M_1 + bN_2M_2 \quad (1)$ where $N_1$ and $N_2$ are the mole fractions of the first and second componen*s, $M_1$ and $M_2$ their molecular masses. Solving eq (1) yields $N_1 = (p/b) - M_2/M_1 - M_2 \quad (2)$ Eq. (2) was used to calculate the composition of the liquid. After settling, samples of the liquid phase were removed for analysis. The parameters, p and b, were determined by an ion-exchange method.	<b>SOURCE AND PURITY OF MATERIALS:</b> Analytical reagent grade $KIO_3$ and $CsIO_3$ were recrystallized from twice-distilled water.  <b>ESTIMATED ERROR:</b> Soly: accuracy $\leq 5\%$ . <b>AUXILIARY INFORMATION</b>																																																												
<b>METHOD/APPARATUS/PROCEDURE:</b> Ternary mixtures stirred and thermostated for 12-14 d. Liquid and solid phases analyzed for all ions. $\text{IO}_3^-$ detd by iodometric titrn, K detd gravimetrically as the tetraphenylborate, and Al by EDTA titrn with Xylenol Orange indicator. Solid phase compositions detd by Schreinemakers' method of residues.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram based on mass % units is given below. 																																																											
<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade $\text{KIO}_3$ used. Aluminum iodate prepd at 80-90°C by neut of satd $\text{HIO}_3$ solution with freshly prepared $\text{Al}(\text{OH})_3$ in stoichiometric quantities. The salt was dried and analyzed: found, mass % Al 4.03; $\text{IO}_3$ 78.7; $\text{H}_2\text{O}$ 17.6. Calcd, mass %: Al 4.09; $\text{IO}_3$ 79.53; $\text{H}_2\text{O}$ 16.38 (by difference)																																																												
<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.																																																												

<b>COMPONENTS:</b> (1) Potassium iodate; $\text{KIO}_3$ ; [13446-17-8] (2) Manganese iodate; $\text{Mn}(\text{IO}_3)_2$ ; [25659-29-4] (3) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Vinogradov, E.E.; Karataeva, I.M.; Lepeshkov, I.N.  <i>Zh. <sup>b</sup> For binary systems the compiler computes the following:																																																																	
soly of $\text{KIO}_3$ = 0.6228 mol kg <sup>-1</sup>																																																																	
soly of $\text{Zn}(\text{IO}_3)_2$ = 0.016 mol kg <sup>-1</sup>																																																																	
<b>AUXILIARY INFORMATION</b>																																																																	
<b>METHOD/APPARATUS/PROCEDURE:</b> Approximately three weeks were needed to reach equilibrium. Potassium content was determined gravimetrically by precipitation with sodium tetraphenylborate, zinc by titration with EDTA, and iodate by titration with thiosulfate solution. The composition of the double compound was proved by X-ray diffraction, derivatograms, and IR spectra.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> 																																																																
<b>SOURCE AND PURITY OF MATERIALS:</b> C.p. grade $\text{KIO}_3$ was used. Zinc iodate was made by pptn from zinc nitrate: no other details given.																																																																	
<b>ESTIMATED ERROR:</b> Nothing specified.

<b>AUXILIARY INFORMATION</b>						
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>			
Isothermal method used. Ternary complexes of known composition were stirred in Pyrex tubes. At equilibrium aliquots of saturated solution were drawn by means of calibrated pipets supplied with filtering tips. The analysis involved determination of total solid by evaporation and iodometric determination of iodate by treatment with iodide and acid, and titration with thiosulfate solution.			$K_2MoO_4$ used was about 99.9 % pure on the basis of volumetric determination of molybdate with standard $AgNO_3$ and standard KCNS in an adaptation of Volhard's method. The salt was recrystallized before use. The source of $KIO_3$ was not given.			
			<b>ESTIMATED ERROR:</b>			
			Nothing specified.

<b>AUXILIARY INFORMATION</b>																																																																																																							
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 30-35 d. Liq and solid phases analyzed for $\text{IO}_3$ by iodometric titrn and for Nd by complexometric titrn in the presence of hexamethylenetetramine with Methyl Thymol Blue indicator. Solid phase compositions detd by Schreinemakers' method of residues.	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram based on mass % units is reproduced below.																																																																																																						
<b>SOURCE AND PURITY OF MATERIALS:</b> $\text{NdIO}_3$ prepd by stoichiometric mixing of $\text{HIO}_3$ and neodymium oxide and stirring of the aqueous mixture for 20 h at 80-90°C. The ppt was filtered, washed repeatedly with hot water, and dried at 110-120°C. The authors state that the purity of the resulting neodymium iodate was checked by chemical analysis, but the results were not reported in the source publication. "Chemically pure" grade $\text{KIO}_3$ was used.																																																																																																							
<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.

<b>AUXILIARY INFORMATION</b>																																																																																
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubility in the $\text{KIO}_3$ - $\text{KOH}$ - $\text{H}_2\text{O}$ system was studied by the isothermal method. Mixtures were stirred in a water thermostat, and equilibrium was reached in 1-2 days. The concentration of hydroxide ion was found by titration with 0.1 mol $\text{dm}^{-3}$ $\text{HCl}$ in the presence of Methyl Orange. The $\text{IO}_3^-$ ion was determined by titration with sodium thio-sulfate solution in the presence of sulfuric acid and $\text{KI}$ . The concentration of $\text{K}^+$ ion was determined gravimetrically by precipitation with sodium tetraphenylborate. The composition of the solid phases was found by Schreinemakers' method of residues.	<b>SOURCE AND PURITY OF MATERIALS:</b> "Chemically pure" grade $\text{KIO}_3$ was used. Commercial $\text{KOH}$ contains considerable amounts of $\text{K}_2\text{CO}_3$ impurity which cannot be removed by recrystallization from water. The materials were purified by recrystallization in silver vessels in a stream of purified nitrogen as the temperature was gradually increased to 250°C.																																																																															
	<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method used. Ternary mixtures were prep'd using the same compounds which constitute the solid phases in the equilibrated systems. This reduced the time required to reach equil to 48 hours. A sample of sat'd sln (or residue) was first titrd with standard alkali to det acid content. Total iodate in the same sample then det'd by titrn with std thiosulfate in the presence of excess KI and HCl. Not all the soly data were reported. Only those results for invariant points and points of congruent solubilities were given. The values at the invariant points are the results of 2 or more closely agreeing results (this may indicate that some data were rejected: compilers).			<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The 50°C isotherm is reproduced below. Concentration units are mass %.

<b>AUXILIARY INFORMATION</b>																																																													
<b>METHOD/APPARATUS/PROCEDURE:</b> The investigation was carried out by isothermal saturation in a thermostat. Potassium iodide and iodate were dissolved in alkaline medium of pH 13.8. After equilibrium was reached, the liquid phase was analyzed for iodate iodometrically, and for iodide argentometrically. The composition of the solid phase was identified by the immersion method described in ref 1.	<b>SOURCE AND PURITY OF MATERIALS:</b> "Chemically pure" grade potassium iodate and iodide were recrystallized from twice-distilled water. Chemically pure grade potassium hydroxide used was freed from carbonate.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b> 1. Melankholin, N.M. <i>Izmerenie Pokazatelei Prelomleniya pod Mikroskopom Immersionnyn Methodom (Measurement of Refractive Indices under a Microscope by the Immersion Method)</i> Iz. Acad. Nauk SSSR. To obtain the fitting equation for solubility of potassium iodate in alkaline medium at pH 13.8 the following equation was used:			
$c_2 = a_0 + a_1 c_1 + a_2 C_1^2$			
where the concentration (c) based on mass % was used.			
The calculated coefficients are given below:			
t/°C	a <sub>0</sub>	a <sub>1</sub>	a <sub>2</sub>
20	0.0340	-0.0642	0.0636
60	0.0857	-0.2047	0.1739
80	0.1219	-0.2984	0.2381
The mean relative error of the experimental and calculated results does not exceed 1.89 % at 20°C, 1.51 % at 60°C and 1.56 % at 80°C.

<b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>	
<p>At 20°C, <math>KClO_3</math> and water were placed in stoppered tubes and thermostated. Weighed aliquots were taken and the amount of solute estimated either by titrn or by evapn to dryness.</p> <p>At 100°C care had to be taken to guard against alteration in the composition of the mixed solvent by evaporation. The method employed was as follows: To a test tube of 10 mm diameter and 5 <math>cm^3</math> capacity was sealed a 20 cm length of tubing about 4 mm in diameter. A sufficient quantity of dry salt and about 3 <math>cm^3</math> of solvent were placed in the tube. The tube was then bent round until it lay parallel with the test-tube and sealed off. The sealed U-tube was rocked in a bath at 100°C for 4 hours. After saturation, the excess solid was brought out into the narrow limb, the wide limb being left about three quarters full of the clear saturated sln. The tubes were removed from the bath and cooled to room temperature. The wide limb was cut off above the level of the sln. The solubility of salt was found by evaporation to dryness and weighing.</p>			Nothing specified.

<b>AUXILIARY INFORMATION</b>																																																					
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of dioxane and water of known proportions were stirred with excess $KIO_3$ in glass stoppered bottles for 2 to 7 days. Equilibrium was established from both under- and super-saturation. Iodate was analyzed by reduction to iodide by sodium thiosulfate, the excess reagent being removed by acidification and boiling with dil $H_2SO_4$ . Except in high dioxane solvents, the resulting iodine solution was analyzed volumetrically at a pH of 9-10 by titrn with standard $AgNO_3$ using eosin indicator. An appropriate blank was calcd from a series of standardizations using pure $KIO_3$ similarly treated. For very low solubilities the iodide was detd gravimetrically as $AgI$ . The densities of the satd slns were detd by weighing filtered samples of slns delivered from calibrated pipets. The values were not reported in the original paper.	<b>SOURCE AND PURITY OF MATERIALS:</b> "C.p. grade" potassium iodate was used. The dioxane was purified and its purity verified as described in ref 1.

<b>AUXILIARY INFORMATION</b>																																																																							
<b>METHOD/APPARATUS/PROCEDURE:</b> The saturated solutions were prepared by the undersaturation and the supersaturation methods. Chlorate was reduced to chloride, and the resulting chloride determined volumetrically by Volhard's method or gravimetrically by precipitation as silver chloride. The reduction was effected by diluting a weighed quantity of the solution with water in an Erlenmeyer flask provided with a Bunsen valve. A moderate excess of acidic ferrous sulfate solution was added and the mixture heated. After cooling, the solution was treated with nitric acid, and excess 0.1 mol dm <sup>-3</sup> silver nitrate added: the excess was titrated with 0.1 mol dm <sup>-3</sup> sulfocyanate solution. For gravimetric determinations, the reduced solution, after treating with silver nitrate, etc. and the resulting silver chloride weighed.	<b>SOURCE AND PURITY OF MATERIALS:</b> U.S. Pharmacopeia quality potassium chlorate and glycine were used.																																																																						
<b>ESTIMATED ERROR:</b> Soly: $\sigma = 0.005$ (compilers). Temp: nothing specified.

<b>AUXILIARY INFORMATION</b>													
<b>METHOD/APPARATUS/PROCEDURE:</b> Solubilities of $\text{KIO}_3$ and DB-18 detd isothermally in pure methanol and methanol satd with DB-18. Satd slns prepd by adding 0.5 mmol of each compound to about 2 drops of alcohol, stirring, and decanting the liquid. To the residue about 10 ml of methanol was added, and the mixt magnetically stirred for 2 days. Two additional days of stirring did not affect the soly. The ether, DB-18, was detd spectrophotometrically in dichloroethane. Quantitative transfer of the ether to dichloroethane was found to be complete after 4 extractions, and Beer's law was followed to at least 1.3 x 10 <sup>-4</sup> mol dm <sup>-3</sup> . $\text{KIO}_3$ was detd by 3 aq extractions from the satd sln and dichloroethane. The combined aq extracts were titrated idometrically. Complete extraction of the iodate was confirmed experimentally. A Markson No. 1002 $\text{K}^+$ specific ion electrode was used to detn the $\text{K}^+$ activity, and Nernstian behavior was observed. Conductivities were measured with an Industrial Instrument Model RC 16B1 bridge with Jones type cells.	<b>SOURCE AND PURITY OF MATERIALS:</b> "C.p." grade (Fisher) $\text{KIO}_3$ recrystallized three times from water and dried at atm pressure at 70°C. Aldrich dibenzo-18-crown-6 (DB-18) was recrystallized 4 times from water and dried at atm pressure at 50°C; m.p. = 163°C, lit, 164°C (2). Methanol (Fisher "spectroquality" grade) was distilled once from Mg turnings.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: nothing specified.  <b>REFERENCES:</b> 1. Pederson, C.J. <i>J. Am. Chem. Soc.</i> <u>1970</u> , 92, 388. 2. Pederson, C.J.; Frensdorff, H.K. <i>Angew. Chem., Int. Ed. Engl.</i> <u>1972</u> , 11, 16.												

<b>COMPONENTS:</b> (1) Potassium iodate; $\text{KIO}_3$ ; [7758-05-6]  (2) Dimethylsulfoxide(sulfinyl bis-methane); $\text{C}_2\text{H}_6\text{OS}$ ; [67-68-5]	<b>ORIGINAL MEASUREMENTS:</b> Kolthoff, I.M.; Chantooni, M.K.  <i>J. Phys. Chem.</i> <u>1973</u> , <i>77</i> , 523-6.
<b>VARIABLES:</b> $T/K = 298$	<b>PREPARED BY:</b> Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b>  (1) Potentiometric determination:  The authors reported $-\log K_{\text{S}0}^{\circ} = 7.7$ from $-\log a(\text{K}^+) = 3.85$ , which was determined potentiometrically assuming $a(\text{IO}_3^-) = a(\text{K}^+)$ .  The compiler computes $K_{\text{S}0}^{\circ} = 2.0 \times 10^{-8} \text{ mol}^2 \text{ dm}^{-6}$ from this value.  (2) Conductance determination:  The authors reported $\log K_{\text{S}0} = -7.4$ from a measured specific conductivity of $0.85 \times 10^{-5} \text{ S cm}^{-1}$ . $\Lambda^{\infty}$ was given as $37.4 \text{ S cm}^2 \text{ mol}^{-1}$ (obtained from the literature), and presumably the limiting law was used to calculate the solubility. Activity coefficients were calculated from the "partially extended" Debye-Huckel equation.  The compiler calculates $K_{\text{S}0} = 4.0 \times 10^{-8} \text{ mol}^2 \text{ dm}^{-6}$ from this value.	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> (1) The solubility product of $\text{KIO}_3$ in dimethylsulfoxide was determined potentiometrically from emf measurements made on the following cell:  $\text{K}(\text{gl})/\text{KIO}_3(\text{c}_1)//\text{AgNO}_3(\text{c}_2)/\text{Ag}$  where $\text{KIO}_3(\text{c}_1)$ and $\text{AgNO}_3(\text{c}_2)$ are concentrations of the saturated $\text{KIO}_3$ solution and $0.01 \text{ mol dm}^{-3} \text{ AgNO}_3$ solution, and // is a salt bridge containing $0.01 \text{ mol dm}^{-3}$ tetraethylammonium perchlorate. The liquid junction potential calculated by the Henderson equation (ref 1) is $-5 \text{ mV}$ , and was neglected.	<b>SOURCE AND PURITY OF MATERIALS:</b> $\text{KIO}_3$ was dried in <i>vacuo</i> at $70^{\circ}\text{C}$ for 3 hours. Dimethylsulfoxide, Fisher certified reagent grade product, was purified as described in ref 3. The water content of the purified solvent as found by Karl Fischer titration was less than 0.0005%. Electrodes were prepared electrolytically (ref 4).
<b>ESTIMATED ERROR:</b>  The uncertainty of $\text{p}K_{\text{S}0}$ is $\pm 0.1$ . Temperature not given.	<b>REFERENCES:</b> 1. Ives, D.J.G.; Janz, G.J. <i>Reference Electrodes</i> . Academic Press. <b>EXPERIMENTAL VALUES:</b> <p>The solubility of <math>KIO_3</math> in liquid ammonia at 25°C was reported as</p> <p style="text-align: center;">0.000 g/100 g <math>NH_3</math></p> <p>Compilers' note: In a subsequent paper (2) Hunt gives the solubility of <math>KIO_3</math> in liquid ammonia as <math>3.044 \times 10^{-5}</math> mol <math>kg^{-1}</math> at 25°C. See the compilation of ref (2).</p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE</b> Two methods were used as described in (1). <u>Method I.</u> 25 ml test tubes with a constriction at the middle were employed. About 10-25 g $NH_3$ were condensed in the bottom, and the dry salt contained in a small tube tightly covered with cotton cloth was added to the test tube; this small tube remained in the upper part of the test tube as it could not pass the constriction in the middle of the test tube. The top of the test tube was drawn to a tip and sealed, and the tube inverted and placed in a thermostat at 25°C. Equilibrium between $NH_3$ and the excess salt in the small covered tube required 1-3 weeks with periodic shaking. The test tube was then inverted and only the saturated solution drained into the lower end (excess solid remained in the small tube covered with the cotton cloth). The solution was frozen and sealed at the constriction, and weighed. The seal was then broken and the $NH_3$ boiled off, and the residue weighed. <u>Method II.</u> Excess $NH_3$ was condensed on a weighed amount of salt in a tube fitted with a stopcock. After thermostating at 25°C, $NH_3$ was slowly permitted to escape through the stopcock until a crystal of solid appeared and remained undissolved upon prolonged shaking. Authors state that the error due to the condensation of gaseous $NH_3$ was not significant since the dead space was kept to a minimum of about 30 $cm^3$ . However this amount of dead space was stated to limit the precision of the method to 0.5 %.	<b>SOURCE AND PURITY OF MATERIALS:</b> Reagent grade $KIO_3$ was recrystallized three times from water and then from "a suitable" anhydrous solvent. The salt was dried to constant weight in a vacuum oven. Purification of $NH_3$ not specified, but probably similar to that described in (1). In (1) commercial anhydrous ammonia was stored over metallic sodium for several weeks before use. <b>ESTIMATED ERROR:</b> Soly: accuracy probably around $\pm 1-2$ % (compilers). Temp: 25.00 + 0.025°C accuracy established by NBS calibration (see ref 1). <b>REFERENCES:</b> 1. Hunt, H.; <i>J. Am. Chem. Soc.</i> <u>1932</u> , 54, 3509. 2. Anhorn, V.J.; Hunt, H. <i>J. Phys. <b>AUXILIARY INFORMATION</b>																																		
<b>METHOD/APPARATUS/PROCEDURE:</b> The U-shaped Pyrex soly apparatus is shown in the figure on the next page. A glass float in which an iron nail was sealed was used to stir the slns by engaging solenoid E. B is a cotton plug in which a small glass tube was embedded to permit passage of $NH_3$ vapors. Both salts were placed in tube G which was then sealed at A, evacuated at F, and the entire apparatus heated in a flame. The apparatus was evacuated for 10 h and then flushed with dry air followed by flushing with $NH_3$ . Ammonia was distd from a reservoir and condensed in tube G, and the apparatus sealed at F. Equilibrium was established by thermostating at 25°C, and was approached from above and below with stirring every 2 h. The satd sln was decanted into tube H, and the distance of the sln from etch mark C measured with a cathatometer. The ammonia was then dist back into tube G, cooled in a bath of solid $CO_2-CHCl_3-CCl_4$ , and the tube H removed by breaking about 2 cm above the etch mark C. The $KIO_3$ content (residue) in H was detd by the method described in (1), and the non-saturating salt was detd gravimetrically by the method given in (2). The volume of	<b>SOURCE AND PURITY OF MATERIALS:</b> Ammonia was stored over sodium and distd through glass wool into a reservoir prior to distn into the soly tube. AR grade $KIO_3$ recrystallized three times from conductivity water, dried at 180°C, ground to a powder and analyzed as in (3). $KCl$ was crystallized three times from conductivity water and dried at 110°C.																																	
<b>ESTIMATED ERROR:</b> Soly: for the binary system, standard dev is .0018 (compilers). No information available for ternary systems. Temp: accuracy $\pm 0.005$ K (authors).

<b>COMPONENTS:</b> (1) Potassium iodate; $KIO_3$ ; [7758-05-6] (2) Hydrazine; $N_2H_4$ ; [302-01-2]	<b>ORIGINAL MEASUREMENTS:</b> Welsh, T.W.B.; Broderson, H.J. <i>J. Am. Chem. Soc.</i> <u>1915</u> , 37, 816-24.
<b>VARIABLES:</b> Room temperature (compiler's assumption)	<b>PREPARED BY:</b> Mark Salomon and Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b> <p>The solubility of <math>KIO_3</math> in hydrazine at room temperature was given as</p> $0.01 \text{ g/cm}^3 \text{ N}_2\text{H}_4$ <p>The authors stated that the chief object of this research was to obtain qualitative and approximate quantitative data.</p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> <p>The solubility vessel was a glass tube to which a U-shaped capillary tube was attached to the bottom. A stopcock at the end of the capillary permitted the adjustment of the rate of flow of dry nitrogen. About 1 cc of anhydrous hydrazine was placed in the tube, and small amounts of <math>NaClO_3</math> added from a weighing bottle. After each addition of <math>NaClO_3</math>, a loosely fitting cork was placed in the top of the solubility tube. Nitrogen was bubbled through solution until the salt dissolved. The process was repeated until no more salt would dissolve. Temperature was not kept constant. The accuracy of this method is very poor. In addition, the authors stated that it was difficult to prevent the oxidation of hydrazine.</p>	<b>SOURCE AND PURITY OF MATERIALS:</b> <p>Anhydrous hydrazine was prepared by first partially dehydrating commercial hydrazine with sodium hydroxide according to the method of Raschig (1). Further removal of water was distilled over barium oxide after the method of de Bruyn (2). The form of distillation apparatus employed and the procedure followed in the respective distillations were those described by Welsh (3). The product was found on analysis to contain 99.7 % hydrazine. The hydrazine was stored in 50 <math>cm^3</math> sealed tubes. Sodium chlorate was the ordinary pure chemicals of standard manufacture.</p> <b>ESTIMATED ERROR:</b> Soly: accuracy $\pm 50\%$ at best (compilers).

Chim. Pays-Bas.</i> <u>1895</u> , 14, 458. 3. Welsh, T.W. <i>J. Am. Chem. Soc.</i> <u>1915</u> , 37, 497.	

<p>COMPONENTS:</p> <p>(1) Rubidium iodate; <math>\text{RbIO}_3</math>; [13446-76-9]</p> <p>(2) Water; <math>\text{H}_2\text{O}</math>; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto Niigata University Niigata, Japan and Mark Salomon US Army ET &amp; DL Fort Monmouth, NJ, USA</p>
<p style="text-align: right;">June, 1986</p> <p>CRITICAL EVALUATION:</p> <p style="text-align: center;">THE BINARY SYSTEM</p> <p>Data for the solubility of <math>\text{RbIO}_3</math> in water have been reported in 15 publications (1-15). Publications (4-15) are studies of ternary systems using the isothermal method, and although some investigators (1-4, 14, 15) did not analyze the solid phase, the evaluators assume it to be the anhydrous salt by analogy to the solid phase found in studies on ternary systems in (5-13). The compilations for references (6,7) are given in the <math>\text{LiIO}_3</math> chapter, for (12) in the <math>\text{NaIO}_3</math> chapter, for (4) in the <math>\text{KIO}_3</math> chapter, and for ref. (13) dealing with the <math>\text{RbIO}_3\text{-Mg}(\text{IO}_3)_2\text{-H}_2\text{O}</math> system in the first volume on Alkaline Earth Metal Halates (16).</p> <p>Analyses of saturated solutions varied: iodometric titration was used in (3-12), the Carius method in (1), gravimetry with sodium tetraphenylborate in (5-10) or with sulfate in (2), and flame photometry in (4).</p> <p>A summary of the solubilities reported in (1-15) is given in Table 1. The results for the approximate temperature of 296 K in (1,2) were rejected as was the obviously high solubility at 323 K reported in (5). The low solubility of 0.00163 mole fraction at 298 K reported in (4) was rejected on the usual basis of its poor fit to the smoothing equations. The remaining data were fitted to the two smoothing equations based on mole fraction and mol/kg solubilities, and the respective results are:</p> $Y_x = -27922/(T/K) - 131.152 \ln (T/K) + 776.99 + 0.18259(T/K)$ $\sigma_y = 0.016 \qquad \sigma_x = 1.4 \times 10^{-5}$ <p>and</p> $Y_m = -4381/(T/K) - 6.236 \ln (T/K) + 50.222$ $\sigma_y = 0.012 \qquad \sigma_m = 0.0017$ <p>All solubilities calculated from the smoothing equations are designated as <i>recommended</i> values.</p> <p style="text-align: center;">TERNARY SYSTEMS</p> <p>1. One saturating component.</p> <p>Solubilities of <math>\text{RbIO}_3</math> in aqueous <math>\text{KNO}_3</math> solutions and in dilute <math>\text{HNO}_3</math> solutions at 298.2 K have been reported by Larson and Renier (14). The solubility of <math>\text{RbIO}_3</math> increases with increasing concentration of <math>\text{KNO}_3</math>, but in <math>\text{HNO}_3</math>, the solubility first increases and reaches a maximum of around <math>0.16 \text{ mol dm}^{-3}</math> at an acid concentration of around <math>0.3 \text{ mol dm}^{-3}</math>.</p> <p>2. Two saturating components.</p> <p>Solubilities in aqueous solutions containing a second saturating component in addition to <math>\text{RbIO}_3</math> have been reported in 10 publications (4-13), and all studies used the isothermal method. A summary of the various ternary systems studied is given in Table 3.</p> <p>The ternary system <math>\text{RbIO}_3\text{-RbOH-H}_2\text{O}</math> is of the simple eutonic type (8), but the dominant features in the ternary systems with <math>\text{HIO}_3</math> (5) and <math>\text{LiIO}_3</math> (6) are the formation of the double salts <math>\text{RbIO}_3 \cdot 2\text{HIO}_3</math> and <math>\text{RbIO}_3 \cdot 2\text{LiIO}_3</math>. No double salts were found in the remaining ternary systems.</p>

<b>COMPONENTS:</b> (1) Rubidium iodate; $\text{RbIO}_3$ ; [13446-76-9] (2) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Wheeler, H.L.  <i>Am. J. Sci.</i> 1892, 44, 123-33.
<b>VARIABLES:</b>  T/K = 296	<b>PREPARED BY:</b>  Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b>  <p style="text-align: center;">The solubility of <math>\text{RbIO}_3</math> in water was given as</p> <p style="text-align: center;">100 parts of water dissolve 2.1 parts of <math>\text{RbIO}_3</math>.</p> <p style="text-align: center;">The compiler's conversions to mass % and <math>\text{mol kg}^{-1}</math> are:</p> <p style="text-align: center;">2.05 mass %</p> <p style="text-align: center;">0.0806 <math>\text{mol kg}^{-1}</math></p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b>  No information was given.	<b>SOURCE AND PURITY OF MATERIALS:</b> Rubidium iodate was prepared by stoichiometric mixing of iodine pentoxide, in either strong or dilute aqueous solution, with a solution of rubidium carbonate. The precipitate, after vacuum filtering, was washed with a little water and dried on paper. Found: Rb 32.17; I 48.50; O 20.59. Calcd for $\text{RbIO}_3$ ; Rb 32.83, I 48.72, O 18.43.
<b>ESTIMATED ERROR:</b>  Nothing specified.	
<b>REFERENCES:</b>	

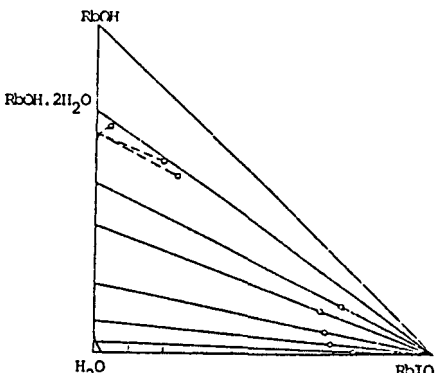

<b>COMPONENTS:</b> (1) Rubidium iodate; $\text{RbIO}_3$ ; [13446-76-9] (2) Water; $\text{H}_2\text{O}$ ; [7732-18-5]	<b>ORIGINAL MEASUREMENTS:</b> Barker, T.V. <i>J. Chem. Soc.</i> <u>1908</u> , 93, 15-6.
<b>VARIABLES:</b> T/K = 296	<b>PREPARED BY:</b> Hiroshi Miyamoto
<b>EXPERIMENTAL VALUES:</b> <p>The solubility of <math>\text{RbIO}_3</math> in water at 23°C is given as follows:</p> <p style="text-align: center;">100 parts of water dissolve 2.1 parts of <math>\text{RbIO}_3</math>.</p> <p>This is equivalent to 0.081 mol <math>\text{kg}^{-1}</math> (compiler).</p> <p>The specific gravity of the saturated solution at 14°C was reported as 4.559.</p> <p>The compiler assumes that precipitation occurred upon cooling the saturated solution at 23°C to 14°C.</p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> The iodine content was estimated by the Carius method (the reference was not given in the original paper), but the compiler assumes that the total solubility was determined by evaporation and heating to constant mass. The heating was carried out in two operations lasting four hours: the first to 150°C, and the second to 250°C. The rubidium content was determined by the usual sulfate method. No other information was given in the original paper.	<b>SOURCE AND PURITY OF MATERIALS:</b> Rubidium iodate was prepared by adding aqueous $\text{HIO}_3$ solution to aqueous rubidium carbonate solution. Another method was also used to prepare rubidium iodate: a good yield was obtained by passing chlorine into a hot concentrated solution of a mixture of rubidium iodide and hydroxide. No other information given.
<b>ESTIMATED ERROR:</b> Nothing specified.	
<b>REFERENCES:</b>

<b>AUXILIARY INFORMATION</b>																																																								
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, soly detd in apparatus shown in figure. At equilibrium, the apparatus was tilted to allow satd sln to filter through connecting tube into weighed test tubes. The test tube was closed with a stopper, withdrawn, and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary soly vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat. The iodate content was determined iodometrically.	<b>SOURCE AND PURITY OF MATERIALS:</b> Results of analysis of $\text{RbIO}_3$ : $\text{RbIO}_3$ content; 99.5 % Impurities, %, K 0.06; Cs 0.13; Na 0.016; $\text{SO}_4$ <0.05; Fe 0.005.

<sup>a</sup> A = $\text{RbIO}_3$ ; B = $\text{RbOH} \cdot 2\text{H}_2\text{O}$																																																												
<sup>b</sup> For the binary system the compiler computes the following:																																																												
$\text{solv of RbIO}_3 = 0.0940 \text{ mol kg}^{-1}$																																																												
<b>AUXILIARY INFORMATION</b>																																																												
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubility in the $\text{RbIO}_3$ - $\text{RbOH}$ - $\text{H}_2\text{O}$ system was studied by the isothermal method. Mixtures were stirred in a water thermostat. Equilibrium was reached in 3-4 days. The concentration of hydroxide ion was found by titration with $0.1 \text{ mol dm}^{-3}$ $\text{HCl}$ in the presence of Methyl Orange. The $\text{IO}_3$ content was detd by titration with sodium thiosulfate solution in the presence of sulfuric acid and KI. Rubidium was determined gravimetrically as the tetraphenylborate. The composition of the solid phases was found by Schreinemakers' method of residues.	<b>SOURCE AND PURITY OF MATERIALS:</b> "C.p." grade $\text{RbIO}_3$ was used. Commercial $\text{RbOH}$ contains considerable amounts of $\text{Rb}_2\text{CO}_3$ impurity which cannot be removed by recryst from water. The hydroxide was purified by recryst in silver vessels in a stream of purified nitrogen as the temp was slowly increased to $250^\circ\text{C}$ .																																																											
<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1 \text{ K}$ .	<b>COMMENTS AND/OR ADDITIONAL DATA:</b>

AUXILIARY INFORMATION				
METHOD/APPARATUS/PROCEDURE:		SOURCE AND PURITY OF MATERIALS:		
Isothermal method used. Equilibrium required 25-30 days. Solid and liquid phases analyzed for Rb by emission spectrometry using solutions of Rb concentration between 0.1 - 100 µg cm <sup>-3</sup> in the presence of 2 % NaCl solution (added to suppress the ionization of Rb atoms). Preliminary experiments established that Hf does not influence the intensity of the emission of Rb. The concentration of Rb was therefore determined by comparing samples of saturated solution previously buffered with 2 % NaCl solution with standard Rb solutions also buffered with 2 % NaCl solution. For liquid phase samples, Hf was determined photometrically using Arsenazo III after reduction of IO <sub>3</sub> with hydroxylamine. For solid phase samples, Rb was analyzed as described above and iodate by iodometric titration. The Hf content was determined by difference. Solid phase samples were identified by the method of residues and by X-ray diffraction. The maximum concentration of RbIO <sub>3</sub> in the solid solution is 2.6 %.		"Highly pure" RbIO <sub>3</sub> was used. Hf(IO <sub>3</sub> ) <sub>4</sub> was prepared from aqueous HIO <sub>3</sub> and freshly precipitated hydrated hafnium oxide under conditions described previously (1). No other information given.		
		<b>ESTIMATED ERROR:</b> Soly: uncertainty in analyses did not exceed 3-8 rel %. Temp: precision given as ± 0.1 K.

<b>AUXILIARY INFORMATION</b>																																																												
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of $\text{Nd}(\text{IO}_3)_3$ , $\text{RbIO}_3$ and water were stirred in a water thermostat. Equilibrium was reached in 30-35 days. The liquid and solid phases were analyzed for $\text{IO}_3^-$ and $\text{Nd}^{3+}$ ions. The iodate ion concentration was determined by titration with sodium thiosulfate in the presence of sulfuric acid and KI. The neodymium content was determined by complexometric titration in the presence of hexamethylenetetramine with Methyl thymol blue indicator. The composition of the solid phases was found by Schreinemakers' method of residues.	<b>SOURCE AND PURITY OF MATERIALS:</b> Neodymium iodate was prep by reacting neodymium oxide and $\text{HIO}_3$ in stoichiometric proportions. The aqueous sln and precipitates were stirred continuously for 20 h at 80-90°C. Then the precipitate was transferred to a filter, washed repeatedly with hot water, and dried at 110-120°C. The authors state that the purity of the resulting neodymium iodate was checked by chemical analysis, but the result was not given in the original paper. Chemically pure grade $\text{RbIO}_3$ was used.  <b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: precision $\pm 0.1$ K.  <b>REFERENCES:</b>

<sup>a</sup> A =  $\text{RbIO}_3$ ; B =  $\text{HIO}_3$ ; C =  $\text{RbIO}_3 \cdot 2\text{HIO}_3$

<sup>b</sup> For binary systems the compiler computes the following:

$$\text{solv of } \text{RbIO}_3 = 0.223 \text{ mol kg}^{-1}$$

$$\text{solv of } \text{HIO}_3 = 18.54 \text{ mol kg}^{-1}$$

AUXILIARY INFORMATION

**METHOD/APPARATUS/PROCEDURE:**  
 The isothermal method was used. Equilibrium between the liquid and solid phases was established in 24 hours. The rubidium iodate content in the samples was determined iodometrically, and  $\text{HIO}_3$  determined by titration with base.

**SOURCE AND PURITY OF MATERIALS:**  
 Rubidium iodate was prepared from iodic acid and rubidium sulfate, and the product was recrystallized. "C.p." grade  $\text{HIO}_3$  was recrystallized.

**ESTIMATED ERROR:**  
 Nothing specified.

**COMMENTS AND/OR ADDITIONAL DATA:**  
 The phase diagram is given below (based on mass % units).

<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> A Markson No. 1002 $\text{K}^+$ specific ion electrode was used to measure $\text{Rb}^+$ activity after conditioning the electrode by soaking in $0.01 \text{ mol dm}^{-3}$ $\text{RbClO}_4$ solution for 3-4 days. The electrode response to $\text{a}_{\text{Rb}^+}$ was "practically" Nernstian.	<b>SOURCE AND PURITY OF MATERIALS:</b> Methanol (Fisher "Spectroquality" grade) distilled from Mg turnings. $\text{RbOH}$ prepared by passing $\text{RbBr}$ through a column of Dowex IX-8 resin in the hydroxide form. $\text{RbIO}_3$ prepared by neutralizing $\text{RbOH}$ with $\text{HIO}_3$ , recrystallized three times from water, and dried at $70^\circ\text{C}$ . <b>ESTIMATED ERROR:</b> Nothing specified. <b>REFERENCES:</b>

<p>COMPONENTS:</p> <p>(1) Cesium iodate; CsIO<sub>3</sub>; [13434-81-4]</p> <p>(2) Water; H<sub>2</sub>O; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto Niigata University Niigata, Japan and Mark Salomon US Army ET &amp; DL Fort Monmouth, NJ, USA</p> <p style="text-align: right;">June, 1986</p>																																				
<p>CRITICAL EVALUATION:</p> <p style="text-align: center;">THE BINARY SYSTEM</p> <p>Data for the solubility of CsIO<sub>3</sub> in water have been reported in 12 publications (1-12). A number of compilations containing solubilities in the binary system can be found elsewhere in this volume: ref. (4) has been compiled in the KIO<sub>3</sub> chapter, ref. (5) is in the RbIO<sub>3</sub> chapter, refs. (7, 8) are in the LiIO<sub>3</sub> chapter, and ref. (11) is in the NaIO<sub>3</sub> chapter.</p> <p>Although some investigators (1-3, 5, 12) did not report the nature of the solid phase in the binary system, the evaluators assume it to be the anhydrous salt by analogy to the anhydrous salt found in studies on ternary systems.</p> <p>A summary of the experimental data converted to mole fraction and mol/kg units by the evaluators and compilers is given in Table 1. In fitting these data to the smoothing equations, it was assumed that there are 24 independent data points to be considered as indicated in the table although it appears that Barker (2) may have used the earlier value reported in (1). In any case, these two data points were rejected on the bases of the uncertainty in experimental temperature (about 297 K), and the fact that their results are close to the experimental values reported by other investigators for 298.2 K. All other data (22 independent values) were used in the smoothing equations, and for mole fraction solubilities the smoothing equation is:</p> $Y_x = -26800/(T/K) - 118.503 \ln (T/K) + 706.355 + 0.15820(T/K)$ $\sigma_y = 0.032 \qquad \sigma_x = 3.2 \times 10^{-5}$ <p>For solubilities in mol/kg units, the smoothing equation is:</p> $Y_m = -5309.8/(T/K) - 8.4748 \ln (T/K) + 66.085$ $\sigma_y = 0.019 \qquad \sigma_m = 0.0026$ <p>The smoothed solubilities at rounded temperatures calculated from these two equations are given in Table 2, and these values are designated as <i>recommended</i> solubilities.</p> <p style="text-align: center;">TERNARY SYSTEMS</p> <p>Data for the solubilities in ternary systems with two saturating components have been reported in 8 publications (4-11). A summary of these studies is given below.</p> <p style="text-align: center;">Summary of solubility studies in aqueous ternary systems</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Ternary system</th> <th style="text-align: center;">T/K</th> <th style="text-align: left;">Solid Phase</th> <th style="text-align: right;">Reference</th> </tr> </thead> <tbody> <tr> <td>CsIO<sub>3</sub> - KIO<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">298</td> <td>CsIO<sub>3</sub>; KIO<sub>3</sub></td> <td style="text-align: right;">4</td> </tr> <tr> <td>CsIO<sub>3</sub> - RbIO<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">298</td> <td>Not given</td> <td style="text-align: right;">5</td> </tr> <tr> <td>CsIO<sub>3</sub> - HIO<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">298</td> <td>CsIO<sub>3</sub>; HIO<sub>3</sub>; CsIO<sub>3</sub>.HIO<sub>3</sub></td> <td style="text-align: right;">6</td> </tr> <tr> <td>CsIO<sub>3</sub> - LiIO<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">298</td> <td>CsIO<sub>3</sub>; LiIO<sub>3</sub></td> <td style="text-align: right;">7</td> </tr> <tr> <td>CsIO<sub>3</sub> - LiIO<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">323</td> <td>CsIO<sub>3</sub>; LiIO<sub>3</sub></td> <td style="text-align: right;">8</td> </tr> <tr> <td>CsIO<sub>3</sub> - CsNO<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">323</td> <td>CsIO<sub>3</sub>; CsNO<sub>3</sub></td> <td style="text-align: right;">9</td> </tr> <tr> <td>CsIO<sub>3</sub> - Al(IO<sub>3</sub>)<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">298</td> <td>CsIO<sub>3</sub>; Al(IO<sub>3</sub>)<sub>3</sub>.6H<sub>2</sub>O</td> <td style="text-align: right;">10</td> </tr> <tr> <td>CsIO<sub>3</sub> - NaIO<sub>3</sub> - H<sub>2</sub>O</td> <td style="text-align: center;">323</td> <td>CsIO<sub>3</sub>; NaIO<sub>3</sub>.H<sub>2</sub>O</td> <td style="text-align: right;">11</td> </tr> </tbody> </table>		Ternary system	T/K	Solid Phase	Reference	CsIO <sub>3</sub> - KIO <sub>3</sub> - H <sub>2</sub> O	298	CsIO <sub>3</sub> ; KIO <sub>3</sub>	4	CsIO <sub>3</sub> - RbIO <sub>3</sub> - H <sub>2</sub> O	298	Not given	5	CsIO <sub>3</sub> - HIO <sub>3</sub> - H <sub>2</sub> O	298	CsIO <sub>3</sub> ; HIO <sub>3</sub> ; CsIO <sub>3</sub> .HIO <sub>3</sub>	6	CsIO <sub>3</sub> - LiIO <sub>3</sub> - H <sub>2</sub> O	298	CsIO <sub>3</sub> ; LiIO <sub>3</sub>	7	CsIO <sub>3</sub> - LiIO <sub>3</sub> - H <sub>2</sub> O	323	CsIO <sub>3</sub> ; LiIO <sub>3</sub>	8	CsIO <sub>3</sub> - CsNO <sub>3</sub> - H <sub>2</sub> O	323	CsIO <sub>3</sub> ; CsNO <sub>3</sub>	9	CsIO <sub>3</sub> - Al(IO <sub>3</sub> ) <sub>3</sub> - H <sub>2</sub> O	298	CsIO <sub>3</sub> ; Al(IO <sub>3</sub> ) <sub>3</sub> .6H <sub>2</sub> O	10	CsIO <sub>3</sub> - NaIO <sub>3</sub> - H <sub>2</sub> O	323	CsIO <sub>3</sub> ; NaIO <sub>3</sub> .H <sub>2</sub> O	11

## CRITICAL EVALUATION:

The System With Iodic Acid. This ternary system was studied by Tatarinov (6), and the dominant feature is the formation of the double salt, CsIO<sub>3</sub>.HIO<sub>3</sub>.

Systems With Other Iodates. Other ternary systems were reported in 7 publications (4, 5, 7-11). Kirgintsev, Shklovskaya and Arkhipov (5) measured solubilities in the ternary CsIO<sub>3</sub>-RbIO<sub>3</sub>-H<sub>2</sub>O system at 298 K, but did not report the composition of the solid phases. In other publications (4, 7-11), no double salts were reported, and all systems studied were of the simple eutonic type.

The CsIO<sub>3</sub>-CsNO<sub>3</sub>-H<sub>2</sub>O system is similar to the systems described in this section, that is, no double salts were formed and this system is of the simple eutonic type.

<b>EXPERIMENTAL VALUES:</b> <p style="text-align: center;">The solubility of CsIO<sub>3</sub> in water at 24°C was given as          100 parts of water dissolves 2.6 parts of salt.          This is equivalent to 0.084 mol kg<sup>-1</sup> (compiler).</p> <p style="text-align: center;">The specific gravity of the saturated solution at 16°C was reported as 4.559. The compiler assumes that pptn occurred upon cooling a satd sln at 24°C to 16°C.</p>	
<b>AUXILIARY INFORMATION</b>	
<b>METHOD/APPARATUS/PROCEDURE:</b> The iodine content was estimated by the Carius method (the reference was not given in the original paper), but the compiler assumes that the total solubility was determined by evaporation and heating to constant mass. The heating was carried out in two operations lasting four hours: the first to 150°C, and the second to 250°C. The cesium content was determined by the usual sulfate method. No other information was given in the original paper.	<b>SOURCE AND PURITY OF MATERIALS:</b> Cesium iodate was prepared by adding aqueous HIO <sub>3</sub> solution to aqueous cesium carbonate solution. Another method was also used to prepare cesium iodate: a good yield was obtained by passing chlorine into a hot concentrated solution of a mixture of cesium iodide and hydroxide. No other information given. <b>ESTIMATED ERROR:</b> Nothing specified. <b>REFERENCES:</b>

High temperature apparatus

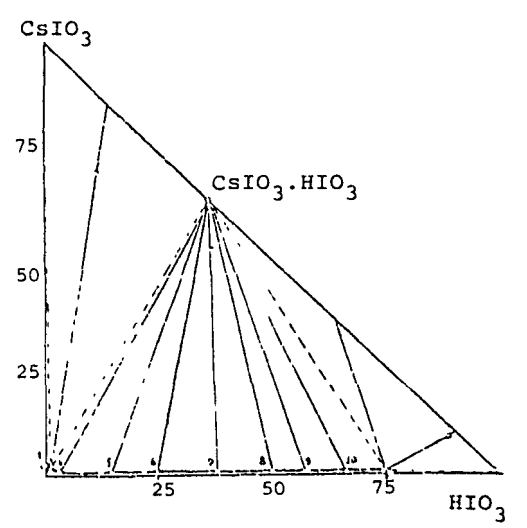

**AUXILIARY INFORMATION**			
**METHOD/APPARATUS/PROCEDURE:**   Isothermal method. Equilibrium reached in 4-5 h. From 90-100°C, soly detd in apparatus shown in figure. At equilibrium, the apparatus was tilted to allow satd sln to filter through connecting tube into weighed test tubes. The test tube was closed with a stopper, withdrawn, and weighed. Condensation on the walls of the apparatus and loss of water by evaporation was thus prevented. At the lower temperatures, ordinary soly vessels were used, and pipets with glass filters were used for sampling (no other details given). Above 50°C, the pipets were preheated in the thermostat. Iodate was determined iodometrically.		**SOURCE AND PURITY OF MATERIALS:**   Results of analysis of CsIO<sub>3</sub>:   CsIO<sub>3</sub> content; 99.5 %   Impurities, %; K 0.005; Rb 0.20;   Na 0.02; SO<sub>4</sub> <0.05; Fe 0.005.	
		**ESTIMATED ERROR:**   Soly: nothing specified.   Temp: precision ± 0.1 K.

<b>AUXILIARY INFORMATION</b>					
<b>METHOD/APPARATUS/PROCEDURE:</b>			<b>SOURCE AND PURITY OF MATERIALS:</b>		
The isothermal method was used. Equilibrium was reached in 15-20 days. The iodate ion concentration in the liquid phase was determined by iodometric titration. The aluminum was determined complexometrically with Trilon(disodium salt of EDTA) and spectrographically. The cesium content was found by difference. The solid phases were identified by the method of residues and checked by X-ray diffraction.			Aluminum iodate hexahydrate was synthesized from iodic acid and aluminum hydroxide. "Special purity" grade cesium iodate was used.

<b>AUXILIARY INFORMATION</b>																																																																																
<b>METHOD/APPARATUS/PROCEDURE:</b> Isothermal method used. Equilibrium required 25-30 days. Solid and liquid phases analyzed for Cs by emission spectrometry using solutions of Cs concentration between 0.1 - 100 µg cm <sup>-3</sup> in the presence of 2 % NaCl solution (added to suppress the ionization of Cs atoms). Preliminary experiments established that Hf does not influence the intensity of the emission of Cs. The concentration of Cs was therefore determined by comparing samples of saturated solution previously buffered with 2 % NaCl solution with standard Cs solutions also buffered with 2 % NaCl solution. For liquid phase samples, Hf was determined photometrically using Arsenazo III after reduction of IO <sub>3</sub> with hydroxylamine. For solid phase samples, Cs was analyzed as described above and iodate by iodometric titr. The Hf content was determined by difference. Solid phase samples were identified by the method of residues and by X-ray diffraction. The maximum concentration of CsIO <sub>3</sub> in the solid solution is 5.8 %.	<b>SOURCE AND PURITY OF MATERIALS:</b> "Highly pure" CsIO <sub>3</sub> was used. Hf(IO <sub>3</sub> ) <sub>4</sub> was prepared from aqueous HIO <sub>3</sub> and freshly precipitated hydrated hafnium oxide under conditions described previously (1). No other information given.  <b>ESTIMATED ERROR:</b> Soly: uncertainty in analyses did not exceed 3-8 rel %. Temp: precision given as ± 0.1 K.  <b>REFERENCES:</b> 1. ## CRITICAL EVALUATION:

## THE BINARY SYSTEM

Data for the solubility of  $\text{NH}_4\text{IO}_3$  in water were reported in 6 publications (1-6). The study of Opalovskii and Kuznetsova (2) deals with the solubility of ammonium iodate in water at various temperatures. The remaining five studies (1, 3-6) deal with ternary systems, and the solubility in the binary system is given as 1 point on a phase diagram.

In the five publications dealing with ternary systems (1, 3-6), the stable solid phase in equilibrium with the saturated solutions was simply anhydrous ammonium iodate. The composition of the solid phase was determined by Schreinemakers' method of residues (1, 3, 5, 6), by X-ray diffraction, thermography, and infrared spectroscopy (5). Opalovskii and Kuznetsova (2) reported the existence of  $\text{NH}_4\text{IO}_3 \cdot 0.75\text{H}_2\text{O}$  crystals which was determined by thermogravimetry and X-ray analysis, but this result has not been confirmed by any other investigator.

In many cases, the iodate content was determined by iodometric titration, and the determination of the ammonium content was carried out by a distillation method (2, 4). Other studies employed the bromate method (3) and gravimetry using sodium tetraphenylborate (5, 6).

## EVALUATION OF DATA

Some investigators reported the solubility in mass % units which the evaluator converted to units of  $\text{mol kg}^{-1}$  using 1977 IUPAC recommended atomic masses. Opalovskii and Kuznetsova (2) reported the solubility of  $\text{NH}_4\text{IO}_3$  in terms of the  $\text{I}_2\text{O}_5$  content, and the evaluator made the conversions to  $\text{mol kg}^{-1}$  units.

Solubility at 298.2 K. The solubility has been reported in 4 publications (2, 4-6). In 2 publications by Tarasova, Vinogradov and Lepeshkov (5, 6), identical solubility values of  $0.200 \text{ mol kg}^{-1}$  were reported. The data of Opalovskii and Kuznetsova (2) were rejected, and the arithmetic mean of 2 independent results from (4, 5), and for which the solid phase is  $\text{NH}_4\text{IO}_3$ , is  $0.199 \text{ mol kg}^{-1}$ . This mean is designated as a recommended value.

Solubility at 303.2 K. Only one value of  $0.227 \text{ mol kg}^{-1}$  was reported by Meerburg (1), and the composition of the stable solid was  $\text{NH}_4\text{IO}_3$ . The value of  $0.227 \text{ mol kg}^{-1}$  is designated as a tentative result.

Solubility at 323.2 K. The solubility has been reported in 2 publications (2, 3). The value of Opalovskii and Kuznetsov (2) is  $0.389 \text{ mol kg}^{-1}$ , and that of Tatarinov (3) is  $0.428 \text{ mol kg}^{-1}$ . The difference between two reported data is large. The solid phase reported in the former study was  $\text{NH}_4\text{IO}_3 \cdot 0.75\text{H}_2\text{O}$ , and that of the latter author was  $\text{NH}_4\text{IO}_3$ . Therefore, the evaluator is unable to average these two values. The result of Tatarinov is designated as a tentative value because their identification of an anhydrous solid phase is consistent with most other data at various temperatures. The results from (2) are rejected.

The recommended and tentative values of solubilities of ammonium iodate in water are given in Table 1.

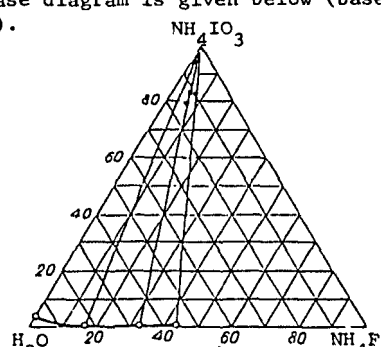

Table 1. Recommended and tentative solubilities in the binary  $\text{NH}_4\text{IO}_3\text{-H}_2\text{O}$  system

T/K	$m_1/\text{mol kg}^{-1}$	Solid phase
298.2 <sup>a</sup>	0.199	$\text{NH}_4\text{IO}_3$
303.2	0.227	"
323.2	0.428	"

<b>AUXILIARY INFORMATION</b>																																								
<b>METHOD/APPARATUS/PROCEDURE:</b> The isothermal method was used. Mixtures of salts and water were stirred in sealed Teflon tubes placed in a thermostat. After equilibrium was established, aliquots of the liquid phases were withdrawn. The ammonia content was determined by distillation method (ref 3). Fluorine was determined with lanthanum nitrate by potentiometric titration using a fluoride ion selective electrode. The iodate concentration was determined iodometrically. The method used to determine composition of the solid phases was not specified.	<b>REFERENCES:</b> 1. ## CRITICAL EVALUATION:

## THE BINARY SYSTEM

Data for the solubility of  $\text{HIO}_3$  in pure water have been reported in 17 publications (1-17). Studies involving ternary systems over the temperature range of 273 - 333 K, confirmed the solid phase to be anhydrous  $\text{HIO}_3$ . Groschuff (2) reported that the eutectic point of ice and  $\text{HIO}_3$  is about 259 K, that the  $\text{HIO}_3 \rightarrow \text{HIO}_3\text{I}_2\text{O}_5$  transition occurs at 383 K, and that the conversion of  $\text{HIO}_3 \cdot \text{I}_2\text{O}_5$  (or  $\text{HI}_3\text{O}_8$ ) to iodic pentoxide,  $\text{I}_2\text{O}_5$  occurs between 463 K and 473 K. It is quite surprising that the phase diagram for the  $\text{HIO}_3\text{-H}_2\text{O}$  system reported in detail by Groschuff in 1905 has never been restudied to confirm both the accuracy and precision of Groschuff's results.

A number of compilations containing solubility data for both binary and ternary systems can be found in other chapters in this volume, or in the earlier volume to this series (27). The location of these compilations are reviewed in Table 1 below.

Table 1. Location of compilations containing  $\text{HIO}_3$  solubility data.

System	Reference	Compilation found in

The Ice Polytherm

The only experimental solubility data along the ice polytherm are those of Groschuff, and the evaluators were unsuccessful in fitting all these data to the smoothing equation. This problem is due to the large standard error of estimate  $\sigma_x$  obtained using all reported data points. This error could be reduced slightly, but too many data points must be ignored (or rejected), and the resulting smoothing equation becomes trivial. The original data for the ice polytherm can be found in the compilation of reference (2).

The  $\text{HIO}_3$  Polytherm

While the data of Groschuff (2) still dominate this part of the phase diagram, there are sufficient data from other studies (see Table 2) which permit fitting of all data to the smoothing equation. As seen from the summary in Table 2, a number of data points were rejected, notably from references (2, 3, 7-9, 12). The remaining data, treated as 23 independent solubility determinations as indicated in Table 2, were fitted to the following smoothing equation:

$$Y_x = 8079/(T/K) + 45.062 \ln (T/K) - 269.85 - 0.05330(T/K)$$

$$\sigma_y = 0.023$$

$$\sigma_x = 0.0037$$

Smoothed solubilities calculated from this smoothing equation are given in Table 3, and all calculated solubilities are designated as *tentative* values.

<p>COMPONENTS:</p> <p>(1) Iodic acid; <math>\text{HIO}_3</math>; [7782-68-5]</p> <p>(2) Water; <math>\text{H}_2\text{O}</math>; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>H. Miyamoto Niigata University Niigata, Japan and M. Salomon US Army ET &amp; DL Fort Monmouth, NJ, USA</p> <p style="text-align: right;">September, 1985</p>
<p>CRITICAL EVALUATION:</p> <p><u>The <math>\text{HIO}_3\text{-I}_2\text{O}_5</math> Polytherm</u></p> <p>Solubility data for <math>\text{HIO}_3</math> for which the solid phase is <math>\text{HIO}_3\text{-I}_2\text{O}_5</math> (or <math>\text{HI}_3\text{O}_5</math>) were reported only by Groschuff in 1905 (2). The four data points reported in (2) over the temperature range 383 - 433 K are given in the compilation of Groschuff's paper.</p> <p>The phase diagram for the binary system over the entire experimental temperature range of 254 K to 433 K is given in Figure 1.</p> <p style="text-align: center;">TERNARY SYSTEMS</p> <p><u>Systems With One Saturating Component</u></p> <p>The solubility of iodine pentoxide in sulfuric acid solutions containing 50 to 106 mass % acid at 279.92 K was reported by Lamb and Phillips: note that the mass % sulfuric acid in excess of 100 % represents the mass of <math>\text{H}_2\text{SO}_4</math> equivalent to 100 g of the acid. Excess <math>\text{SO}_3</math> accounts for mass % values greater than 100 %: e.g. the acid content of 106 % contained 29 mass % <math>\text{SO}_3</math>. All data (both the "initial" and "final" sets of data as given in the compilation) were used to plot the phase diagram for this system. The phase diagram is given in Figure 2. According to the authors (19), the "initial" set of data correspond to <math>\text{HIO}_3</math> solubilities in which there is a slow transformation to a less soluble substance. The shape of the lower isotherm (based on the "final" set of solubility data) was attributed by Lamb and Phillips to the solubility of <math>\text{I}_2\text{O}_5</math> and anhydro iodic acid (<math>\text{HI}_3\text{O}_5</math>). It would appear that this simple explanation to the complex phase diagram in Figure 2 is in fact too simple, and that new studies are required to correctly identify all solid phases present in this system.</p> <p>The solubilities in <math>\text{HNO}_3</math> and HF systems were reported in (2,3) and (7), respectively. In the latter work (7), several solutions of high HF content yielded a solid phase containing the compound <math>2\text{HIO}_3\cdot 3\text{HF}</math>.</p> <p><u>Ternary Systems Containing Two Saturating Components</u></p> <p>Saturated solutions containing <math>\text{HIO}_3</math> and an alkali metal iodate have been summarized in Table 1 above. There does not appear to be any major disagreement in any of these works. However, it should be noted that for the <math>\text{NaIO}_3\text{-HIO}_3\text{-H}_2\text{O}</math> system, Meerburg (1) found the compounds <math>\text{Na}_2\text{I}_4\text{O}_{11}</math> and <math>\text{NaH}_2\text{I}_3\text{O}_9</math> but he did not report <math>\text{NaI}_3\text{O}_8</math> which was found in the work of Shibuya and Watanabe (21).</p> <p>The solubility of <math>\text{HIO}_3</math> in solutions saturated with alkaline earth iodates and with transition and rare earth metal iodates are summarized in Tables 4 and 5, respectively. Note that all the compilations for the systems summarized in Table 4 were previously given in the earlier volume to this series (27).</p> <p style="text-align: center;">QUATERNARY SYSTEMS</p> <p>Two quaternary systems have been reported which are:</p> <p style="text-align: center;"><math>\text{HIO}_3 - \text{LiIO}_3 - \text{KIO}_3 - \text{H}_2\text{O}</math>      at 323 K (24)</p> <p>and</p> <p style="text-align: center;"><math>\text{HIO}_3 - \text{LiIO}_3 - \text{Al}(\text{IO}_3)_3 - \text{H}_2\text{O}</math>      at 298 K (25).</p> <p>The compilations for both (24 and 25) can be found in the <math>\text{LiIO}_3</math> chapter in this volume.</p>

<b>AUXILIARY INFORMATION</b>																
<b>METHOD/APPARATUS/PROCEDURE:</b> Nothing specified, but the compilers assume that saturated solutions were evaporated and the residue dried and weighed.	<b>SOURCE AND PURITY OF MATERIALS:</b> $I_2O_5$ prepd by oxidn of $I_2$ with $N_2O_5$ . Dry or preferably moist $I_2$ treated with $N_2O_5$ prepd from pre-cooled mixt of fuming $HNO_3$ + $P_2O_5$ followed by slow heating to 90°C. The product was dissolved in water, and the water was then evaporated and the solid dried at 220°C.  The yield of $I_2O_5$ is 20 g per each 100 g of fuming $HNO_3$ . "High purity" $I_2$ used: source and purity of water not specified.															
<b>COMMENTS AND/OR ADDITIONAL DATA:</b>  The major objective of this work was to prep highly purified $I_2O_5$ . Previous preps said to involve pptn of $HIO_3$ from solutions of $Ba(IO_3)_2$ + $H_2SO_4$ followed by recryst of $HIO_3$ . Author claims this method cannot eliminate impurities: $Ba(IO_3)_2$ when this salt is used in excess or $BaSO_4$ and $H_2SO_4$ when sulfuric acid is used in excess. Author determined that a solution of 96 g $I_2O_5$ in 100 g $H_2O$ will dissolve 0.15 g $BaSO_4$ at 15°C.  Author also states that $Ba(IO_3)_2$ , $BaSO_4$ and $H_2SO_4$ impurities can be significantly reduced by recrystallizing the impure $HIO_3$ from concentrated nitric acide solution. Starting with an initial impurity level of 0.3 mass %, and recrystallizing five times from concentrated nitric acid, the impurity level was reduced to 0.008 mass %.	<b>ESTIMATED ERROR:</b>  Nothing specified.

<b>AUXILIARY INFORMATION</b>																																																																																		
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of varying composition were placed in an electric thermostat at 25°C and constantly agitated. Samples of the saturated solution were taken over 24 h intervals. The samples of saturated soln were rapidly filtered in a porous plaque-funnel inside the thermostat, and the $\text{HIO}_3$ content determined gravimetrically after evaporation of $\text{HNO}_3$ and water. In their original Table 1, the authors included solubility data of Groschuff (1) and Guichard (2). These data were omitted from the above Table 1, but have been compiled elsewhere in this volume  <b>COMMENTS AND/OR ADDITIONAL DATA</b> The authors state that the data in Table 2 were calculated from the experimental results in Table 1. No other details were given, and the compilers assume that the data in Table 2 referred to as "interpolated" are averages or close to average values.	<b>SOURCE AND PURITY OF MATERIALS:</b> Nothing specified.  <b>ESTIMATED ERROR:</b> Soly: nothing specified, but errors in accuracy may be as high as 3%. <b>AUXILIARY INFORMATION</b>																																																																	
<b>METHOD/APPARATUS/PROCEDURE:</b> Mixtures of excess iodine pentoxide (5-8g) with 100-150 ml of the various solutions of sulfuric acid contained in 200 ml bottles having carefully ground stoppered and tightly fitting protective caps, were rotated in a water thermostat.  The samples for analysis were withdrawn with a special filter-pipet. The filter consisted of a plug of asbestos wool packed in a bulb 1 cm in diameter on an extension tube which was attached to the tip of the pipet by a ground glass joint. The pipet was operated by an efficient water pump.  The filtered 10-20ml samples were diluted to 250-500 ml. Aliquot portions were then treated with an excess of potassium iodide and titrated with 0.1 N sodium thiosulfate solution.	<b>SOURCE AND PURITY OF MATERIALS:</b> Very pure iodine pentoxide was prepared by the chloric acid method (ref. 1). The water content of the product was 0.55 % corresponding to 10.7 % conversion into iodic acid (HIO <sub>3</sub> ). The solutions of sulfuric acid were prepared by weight from a large stock sample of pure sulfuric acid. The concentration of this stock acid was ascertained by comparison of a diluted, weighed sample with a solution of 1 N hydrochloric acid.  <b>ESTIMATED ERROR:</b> Soly: nothing specified.  Temp: precision 0.005 K  <b>REFERENCES:</b> 1. Lamb, A. B.; Bray, W. C.; Geldard, W. J. <i>J. Am. Chem. Soc.</i> <u>1920</u> , 42, 1636.

## EXPERIMENTAL VALUES: (continued)

- (2) With acid of higher concentrations (82-96 mass %) definite "initial" values of the solubilities are rapidly established, as shown by the results collected in Table 2.

Table 2.

Time Hours	H <sub>2</sub> SO <sub>4</sub> / mass %	82.0	86.0	90.3	95.96	95.96
Solubility of iodine oxide (g dm <sup>-3</sup> )						
1		19.51 <sup>a</sup>	20.98	22.63 <sup>a</sup>	----	----
2		19.60	21.03	22.80	22.94	23.15
4		19.78	21.08	22.66	23.22	23.56
6		19.87	21.07	22.62	23.07	23.40
24		19.70	21.07	22.60	----	----
Av		19.74	21.4	22.67	23.08	23.37
		19.9 <sup>b</sup>	21.0 <sup>b</sup>	22.7 <sup>b</sup>		23.2 <sup>b</sup>

<sup>a</sup>These determinations were made independently of the others on fresh samples of sulfuric acid.

<sup>b</sup>The values are listed in "Initial" of Table 3

- (3) After the mixtures of iodine pentoxide and water were rotated for 40 days, the final solubilities were obtained. The values are listed in Table 3.

The authors reported that the initial values represent solubilities of iodic acid (HIO<sub>3</sub>) and the final values represent solubilities of iodine pentoxide and of anhydro iodic acid (HI<sub>3</sub>O<sub>8</sub>).

<b>AUXILIARY INFORMATION</b>																																																																													
<b>METHOD/APPARATUS/PROCEDURE:</b> The compiler assumes that the isothermal method was used. The attainment of equilibrium was deduced from the constancy of the iodate ion concentration in the liquid phase. The time required for equilibrium was 40 hours. Iodic acid in the liquid phase was determined by iodometric titration. Lanthanum concentration in solution could not be determined owing to the very low solubility	<b>COMMENTS AND/OR ADDITIONAL DATA:</b> The phase diagram is given below (based on mass % units). <div style="text-align: center;"> </div>																																																																												
<b>SOURCE AND PURITY OF MATERIALS:</b> Chemically pure grade iodic acid was used. Lanthanum iodate was synthesized from lanthanum nitrate and potassium iodate.																																																																													
<b>ESTIMATED ERROR:</b> Nothing specified.

<b>AUXILIARY INFORMATION</b>				
<b>METHOD/APPARATUS/PROCEDURE:</b>		<b>SOURCE AND PURITY OF MATERIALS:</b>		
The experiments were carried out in a water thermostat with an electric heater. Equilibrium was established in 18 to 21 days. The liquid phases were analyzed for $\text{Nd}^{3+}$ and $\text{IO}_3^-$ ions. The iodate concentration was determined by titration with sodium thiosulfate in the presence of sulfuric acid and potassium iodide. The neodymium content was determined by complexometric titration with hexamethylenetetramine and methyl thymol blue indicator. The composition of the solid phase was determined by Schreinemakers' method of "residues", and identified by X-ray diffraction.		Chemically pure grade iodic acid was used. Neodymium iodate was made from neodymium oxide and iodic acid.		
		<b>ESTIMATED ERROR:</b> Soly: nothing specified. Temp: $\pm 0.1$ K (authors).

<b>AUXILIARY INFORMATION</b>																				
<b>METHOD/APPARATUS/PROCEDURE:</b> The solubility was studied by the isothermal method. Equilibrium in the system was reached after continuous stirring for 10-12 hours. Acetanilide was found from amount of nitrogen determined by the Kjeldahl method, or by titration with 0.05N potassium bromate solution (ref 1). Iodic acid was determined by titration with 0.1N sodium thiosulfate solution. The compositions of the solid phases were found by Schreinemakers' method of residues.	<b>SOURCE AND PURITY OF MATERIALS:</b> "Analytical reagent" grade acetanilide and "chemically pure" grade iodic acid were used.  <b>ESTIMATED ERROR:</b> Nothing specified.  <b>REFERENCES:</b> 1. Suslennikova, V. M.; Kiseleva, E. K. <i>Rukovodstvo po Prigotovleniya Titrovannykh Rastvorov (Handbook on the Preparation of Titrating Solutions)</i> Izd. Khimya, Leningrad 1973.

Bromic acid, lithium salt	
+ 2-propanone	194
+ water	E184-E187, 188-191
Bromic acid, lithium salt (aqueous)	
+ bromic acid, lithium salt	192
+ bromic acid, sodium salt	192
+ sulfuric acid, lithium salt	193
Bromic acid, potassium salt	
+ ammonia	257
+ 2-furan carboxaldehyde	255
+ N-methylacetamide	256
+ water	E220-E223, 224-253
+ water-d2	227
Bromic acid, potassium salt (aqueous)	
+ acetamide	253
+ acetic acid	248
+ acetic acid, methyl ester	250
+ ammonia	253
+ bromic acid, barium salt	239
+ bromic acid, cesium salt	238
+ bromic acid, rubidium salt	237
+ bromic acid, samarium salt	241
+ bromic acid, silver salt	242
+ bromic acid, yttrium salt	240

Bromic acid, potassium salt (aqueous)	
+ carbamic acid, ethyl ester	253
+ chloric acid, potassium salt	E109, 142, 143
+ dimethylpyrone	252
+ 1,2-ethanediol	243
+ ethanol	243
+ N-ethylethanamine	251
+ formaldehyde	246
+ formamide	253
+ D-glucose	245
+ glycine	248
+ D-mannitol	245
+ methanol	243
+ 2-methyl-2-butanol	243
+ nitric acid, potassium salt	230
+ nitric acid, sodium salt	228
+ 1,1'-oxybisethane	244
+ phenol	249
+ piperidine	251
+ potassium bromide	233-235
+ potassium chloride	232
+ potassium iodide	236
+ 1,2,3-propanetriol	243
+ 1-propanol	243
+ 2-propanone	247
+ pyridine	251
+ sodium chloride	229
+ sulfuric acid, potassium salt	231
+ urea	253
Bromic acid, potassium salt (in ethanol)	
+ lithium chloride	254
Bromic acid, rubidium salt	
+ water	E258, E259, 260-262
Bromic acid, rubidium salt (aqueous)	
+ bromic acid, cesium salt	262
+ bromic acid, potassium salt	237
Bromic acid, samarium salt (aqueous)	
+ bromic acid, potassium salt	241
Bromic acid, silver salt (aqueous)	
+ bromic acid, potassium salt	242
+ bromic acid, sodium salt	214, 215
Bromic acid, sodium salt	
+ hydrazine	219
+ N-methylacetamide	218
+ water	E195-E197, 198-217
Bromic acid, sodium salt (aqueous)	
+ bromic acid, lithium salt	192
+ bromic acid, silver salt	214, 215
+ carbonic acid, disodium salt	201, 216
+ carbonic acid, monosodium salt	202, 217
+ chloric acid, sodium salt	E29, 62, 63
+ disodium (I-4)-tetroxomolybdate (2-)	200
+ nitric acid, sodium salt	203
+ sodium bromide	E196, 210-212, 216, 217
+ sodium chloride	208, 209
+ sodium iodide	213
+ sulfuric acid, sodium salt	204-207
+ water-d2	199
Bromic acid, yttrium salt (aqueous)	
+ bromic acid, potassium salt	240
2-Butanol, 2-methyl- (aqueous)	
+ bromic acid, potassium salt	243
Carbamic acid, ethyl ester (aqueous)	
+ bromic acid, potassium salt	253
Carbonic acid, dilithium salt (aqueous)	
+ iodic acid, lithium salt	E272, 293
Carbonic acid, disodium salt (aqueous)	
+ bromic acid, sodium salt	201, 216
+ chloric acid, sodium salt	E31, E32, 82, 85, E338
+ chlorous acid, sodium salt	E31, E32, 85
+ iodic acid, sodium salt	E337, E338, 344, 345

Carbonic acid, disodium salt (aqueous)	
+ sodium bromide	216
+ sodium chloride	E31, E32, 82
Carbonic acid, monosodium salt (aqueous)	
+ bromic acid, sodium salt	202, 217
+ sodium bromide	217
Cesium bromate	see bromic acid, cesium salt
Cesium chlorate	see chloric acid, cesium salt
Cesium chloride (aqueous)	
+ chloric acid, cesium salt	E164, 174, 175
+ chloric acid, cesium salt	E177, E178, 182, 183
+ chloric acid, rubidium salt	E164, 174, 175, E178
+ chloric acid, sodium salt	E178
+ rubidium chloride	E164, 174, 175, E178
+ sodium chloride	E178
Cesium iodate	see iodic acid, cesium salt
Chloric acid, barium salt (aqueous)	
+ chloric acid, sodium salt	E29, 73
Chloric acid, calcium salt (aqueous)	
+ chloric acid, cesium salt	E177, E178, 183
+ chloric acid, potassium salt	E108, 150
Chloric acid, cesium salt	
+ water	E176-E178, 179-183
Chloric acid, cesium salt (aqueous)	
+ cesium chloride	E31, E164, 174, 175
+ chloric acid, calcium salt	E177, E178, 182, 183
+ chloric acid, potassium salt	E177, E178, 183
+ chloric acid, rubidium salt	E108, 149, E177, E178
+ chloric acid, sodium salt	E164, 173-175, E177, E178
+ rubidium chloride	E29, E31, 72, E177, E178
+ sodium chloride	E164, 174, 175, E178
+ water	E31, E178
Chloric acid, lithium salt	
+ 2-propanone	23
+ water	E1-E10, 11-22
Chloric acid, lithium salt (aqueous)	
+ lithium chloride	E4, 20-22
Chloric acid, potassium salt	
+ 2-aminoethanol	158
+ ammonia	161
+ dimethylformamide	160
+ 1,2-ethanediamine	159
+ 1,2-ethanediol	157
+ water	E105-E112, 113-156
Chloric acid, potassium salt (aqueous)	
+ bromic acid, potassium salt	E109, 142, 143
+ chloric acid, calcium salt	E108, 150
+ chloric acid, cesium salt	E108, 149, E177, E178
+ chloric acid, rubidium salt	E108, E110, 139, 140, 148, E164
+ chloric acid, sodium salt	E29, E31, 68-70
+ ethanol	E108, 151, 152
+ glycine	E108
+ iodic acid, potassium salt	145, 146, E380
+ nitric acid, potassium salt	122
+ perchloric acid, potassium salt	E109, E110, 137, 138
+ potassium bromide	E108, E109, 141
+ potassium chloride	E31, E108, E110, 125-140, E164
+ potassium hydroxide	E108, 147
+ potassium iodide	E108, E109, 144
+ 1,2,3-propanetriol	E108, 153
+ 2-propanone	E108, 154-156
+ rubidium chloride	E110, 139, 140, E164
+ sodium chloride	E31, E108, E109, 121
+ sulfuric acid, potassium salt	123, 124
+ water-d2	119, 120

- Chloric acid, rubidium salt  
+ water E162-E165, 166-175
- Chloric acid, rubidium salt (aqueous)  
+ cesium chloride E164, 174, 175, E178  
+ chloric acid, cesium salt E164, 173-175, E177, E178  
+ chloric acid, potassium salt E108, E110, 139, 140, 148, E164  
+ chloric acid, sodium salt E29, E31, 71, E164  
+ nitric acid, rubidium salt E164, 169, 170  
+ potassium chloride E110, E164  
+ rubidium chloride E31, E110, 139, 140  
E164, 171, 172, 174, 175, E178  
+ sodium chloride E31, E164
- Chloric acid, silver salt  
+ water 79, 80
- Chloric acid, silver salt (aqueous)  
+ chloric acid, sodium salt 79, 80
- Chloric acid, sodium salt  
+ 2-aminoethanol 99  
+ 1,2-ethanediamine 101  
+ 1,2-ethanediol 98  
+ dimethylformamide 103  
+ hydrazine 104  
+ 2-propanone 100  
+ tetrahydrothiophene, 1,1-dioxide 103  
+ water E24-E33, 34-97
- Chloric acid, sodium salt (aqueous)  
+ barium chloride E28, E29  
+ boric acid, sodium salt E30, 37-40  
+ bromic acid, sodium salt E29, 62, 63  
+ carbonic acid, disodium salt E30, E31, E32, 82, 85  
+ cesium chloride E31, E178  
+ chloric acid, barium salt E29, 73  
+ chloric acid, cesium salt E29, E31, 72, E177, E178  
+ chloric acid, potassium salt E29, E31, 68-70  
+ chloric acid, rubidium salt E29, E31, 71, E164  
+ chloric acid, silver salt 79, 80  
+ chlorous acid, sodium salt E29, E31, E32, 83-89  
+ chromic acid, disodium salt E30, 74, 75  
+ disodium salt (I-4)-teroxomolybdate (2-) E30, 76, 77  
+ iodic acid, sodium salt 65, 66  
+ nitric acid, calcium salt 78  
+ nitric acid, sodium salt E30, 41  
+ potassium chloride E28, E29, E31  
+ rubidium chloride E31, E164  
+ sodium bromide E28, 61  
+ sodium chloride E28, E31, E32, 51-58, 82-84, 86-89, E164, E178  
+ sodium fluoride E28, 50  
+ sodium hydroxide E30, 67  
+ sodium iodide E28  
+ sulfuric acid, sodium salt E30, 42-49  
+ urea 81
- Chlorous acid, sodium salt (aqueous)  
+ carbonic acid, disodium salt E1, E32, 85  
+ chloric acid, sodium salt E29, E31, E32, 83-89  
+ sodium chloride E31, E32, 59, 60, 83, 84, 86-89
- Chromic acid, disodium salt (aqueous)  
+ chloric acid, sodium salt E30, 74, 75
- Dibenzo-18-crown-6 see [1,4,7,10,13,16] hexaaxocyclooctadecin,  
6,7,10,17,18,20,21-octahydrodibenzo [b,k]
- Diethylamine see ethanamine, N-ethyl-
- Dimethyl formamide see formamide, dimethyl-
- 2,4-Dimethyl-4H-pyran-4-one see pyrone, dimethyl-
- 2,5-Dimethyl-4H-pyran-4-one see pyrone, dimethyl-

3,4-Dimethyl-2H-pyron-2-one	see pyrone, dimethyl-	
3,5-Dimethyl-2H-pyron-2-one	see pyrone, dimethyl-	
3,5-Dimethyl-4H-pyran-4-one	see pyrone, dimethyl-	
3,6-Dimethyl-2H-pyron-2-one	see pyrone, dimethyl-	
4,5-Dimethyl-2H-pyron-2-one	see pyrone, dimethyl-	
4,6-Dimethyl-2H-pyron-2-one	see pyrone, dimethyl-	
Dimethylsulfoxide	see methane, 1,1-sulfinylbis-	
1,4-Dioxane		
	+ iodic acid, potassium salt	E378, 412
Disodium (I-4)-tetroxomolybdate (2-)		
	+ bromic acid, sodium salt	200
	+ chloric acid, sodium salt	E30, 76, 77
	+ iodic acid, sodium salt	E337, E338, 343
	+ iodic acid, potassium salt	E380, 403
Ethanamine, N-ethyl- (aqueous)		
	+ bromic acid, potassium salt	251
1,2-Ethanediamine		
	+ chloric acid, potassium salt	159
	+ chloric acid, sodium salt	101
1,2-Ethandiol		
	+ chloric acid, potassium salt	157
	+ chloric acid, sodium salt	98
1,2-Ethandiol (aqueous)		
	+ bromic acid, potassium salt	243
Ethane, 1,1'-oxybis - (aqueous)		
	+ bromic acid, potassium salt	244
Ethanol		
	+ bromic acid, potassium salt	254
Ethanol (aqueous)		
	+ bromic acid, potassium salt	243
	+ chloric acid, potassium salt	E108, 151, 152
	+ iodic acid, lithium salt	E270, 328
	+ iodic acid, potassium salt	411
Ethanol, 2-amino-		
	+ chloric acid, potassium salt	158
	+ chloric acid, sodium salt	99
Ethyl carbonate	see carbamic acid, ethylester	
Ethyl ether	see ethane, 1,1'-oxybis-	
Ethylene glycol	see 1, 2-ethandiol	
Ethylenediamine	see 1,2-ethanediamine	
Formaldehyde (aqueous)		
	+ bromic acid, potassium salt	246
Formamide (aqueous)		
	+ bromic acid, potassium salt	253
Formamide, dimethyl-		
	+ chloric acid, potassium salt	160, 414, 415
	+ chloric acid, sodium salt	102
	+ iodic acid, cesium salt	458, 459
	+ iodic acid, rubidium salt	444, 445
2-Furancarboxaldehyde		
	+ bromic acid, potassium salt	255
D-Glucose (aqueous)		
	+ bromic acid, potassium salt	245
Glycerol	see 1,2,3-propanetriol	
Glycine (aqueous)		
	+ bromic acid, potassium salt	248
	+ chloric acid, potassium salt	E108, 413
[1,4,7,10,13,16] Hexaoxocyclooctadecin, 6,7,10,17,18,20,21-octa-		
hydrodibenzo [b,k]		
	+ iodic acid, potassium salt	418
	+ iodic acid, rubidium salt	447
	+ iodic acid, sodium salt	373
	+ methanol	373, 418, 447
Hydrazine		
	+ bromic acid, sodium salt	219
	+ chloric acid, sodium salt	104
	+ iodic acid, potassium salt	427

Hydrofluoric acid, (aqueous)	
+ iodine acid	E470, 478
Iodine acid	
+ hydrofluoric acid	E470, 478
+ iodine acid, aluminium salt	E272, 323, 324, E467, E470, E471, 483
+ iodine acid, ammonium salt	E462, 465, 466, E467
+ iodine acid, barium salt	E471
+ iodine acid, cadmium salt	E471, 481
+ iodine acid, cesium salt	E448, E449, 457, E467
+ iodine acid, lanthanum salt	E471, 486
+ iodine acid, lithium salt	
E269, E270, E272, 279, 314-319, 321-324, E380, E467, E470	
+ iodine acid, magnesium salt	E471
+ iodine acid, neodymium salt	E471, 487, 488
+ iodine acid, potassium salt	
E272, 321, 322, E378, E380, 407, 408, E467, E470	
+ iodine acid, rubidium salt	E428, E430, E467
+ iodine acid, scandium salt	E471, 484
+ iodine acid, sodium salt	E335, 371, 372, E467
+ iodine acid, strontium salt	E471
+ iodine acid, zinc salt	E471, 482
+ nitric acid	E470, 475-477
+ N-phenylacetamide	489
+ water	E467-E473, 474-489
Iodine acid, aluminium salt	
+ water	E461, E462, 463-466
Iodine acid, aluminium salt (aqueous)	
+ iodine acid	E272, 323, 324, E470, E471, 483
+ iodine acid, cesium salt	E448, 455
+ iodine acid, lithium salt	
E271-E273, 298, 299, 323, 324, E470	
+ iodine acid, rubidium salt	E430, 440
+ iodine acid, sodium salt	E335, 369
+ iodine acid, potassium salt	E379, 398
Iodine acid, ammonium salt (aqueous)	
+ ammonium fluoride	E462, 464
+ iodine acid	E462
+ iodine acid, lithium salt	E271, 280, E462
+ iodine acid, magnesium salt	E462
Iodine acid, barium salt (aqueous)	
+ iodine acid	E471
+ iodine acid, potassium salt	E378, 397
Iodine acid, cadmium salt (aqueous)	
+ iodine acid	E471, 481
Iodine acid, calcium salt	
+ water	E448-E450, 451-460
Iodine acid, calcium salt (aqueous)	
+ iodine acid, lithium salt	E270, E271
+ iodine acid, sodium salt	E335
Iodine acid, cesium salt (aqueous)	
+ N,N-dimethylformamide	458, 459
+ iodine acid	E448, E449, 457, E467
+ iodine acid, aluminium salt	E448, 455
+ iodine acid, hafnium salt	456
+ iodine acid, lithium salt	E270, 291, 292, E448
+ iodine acid, potassium salt	E378, 396, E448
+ iodine acid, rubidium salt	E430, 438, E448, E449
+ iodine acid, sodium salt	E335, 367, E448
+ nitric acid, cesium salt	E448, E449, 454
+ 1,1-sulfinylbismethane	460
Iodine acid, cobalt salt (aqueous)	
+ iodine acid, potassium salt	E379, 400
Iodine acid, copper salt (aqueous)	
+ iodine acid, potassium salt	E379
Iodine acid, gallium salt (aqueous)	
+ iodine acid, lithium salt	E271, 300, 301
Iodine acid, hafnium salt (aqueous)	
+ iodine acid, cesium salt	456
+ iodine acid, lithium salt	E271, E272, 308, 309

Iodic acid, hafnium salt (aqueous)	
+ iodic acid, rubidium salt	441
+ iodic acid, sodium salt	335, 370
Iodic acid, indium salt (aqueous)	
+ iodic acid, lithium salt	E271, E272, 302, 303
Iodic acid, lanthanum salt (aqueous)	
+ iodic acid	E471, 486
Iodic acid, lithium salt	
+ 2-propanone	329
+ water	E268-E275, 276-328
Iodic acid, lithium salt (aqueous)	
+ carbonic acid, dilithium salt	E272, 293
+ ethanol	E270, 328
+ iodic acid	E269, E270, E272, 279, 314-319, 321-324, E380, E467, E470
+ iodic acid, aluminium salt	E271-E273, 298, 299, 323, 324, E470
+ iodic acid, ammonium salt	E271, E272, 280
+ iodic acid, calcium salt	E270, E271
+ iodic acid, cesium salt	E270, 291, 292, E448
+ iodic acid, gallium salt	E271, 300, 301
+ iodic acid, hafnium salt	E271, E272, 308, 309
+ iodic acid, indium salt	E271, E272, 302, 303
+ iodic acid, magnesium salt	E270, E271
+ iodic acid, neodymium salt	E271, 311
+ iodic acid, potassium salt	E270, E272, E273, 286, 287, 321, 322, 325-327, E378, E380, E470
+ iodic acid, rubidium salt	E270, 288-290, E428, E430
+ iodic acid, samarium salt	E271, 312
+ iodic acid, silver salt	E271, E272, 297
+ iodic acid, sodium salt	E270, 285, E335
+ iodic acid, thallium salt	E271, 304
+ iodic acid, titanium salt	E271, E272, 305, 306
+ iodic acid, zirconium salt	E271, E272, 307
+ lithium bromide	E272, 283
+ lithium chloride	E272, 282
+ lithium hydroxide	E270, E273, 313, 325-327
+ lithium iodide	E272, 284
+ lithium (I-4)-tetraoxorhenate (1-)	E272, 310
+ nitric acid, lithium salt	E272, 294, 295
+ phosphoric acid	320
+ phosphoric acid, monolithium salt	320
+ phosphoric acid, trilithium salt	E272, 296
+ potassium hydroxide	E273, 325-327, E380
+ sulfuric acid, lithium salt	E272, 281
Iodic acid, magnesium salt (aqueous)	
+ iodic acid	E471
+ iodic acid, lithium salt	E270, E271
+ iodic acid, sodium salt	E335
+ iodic acid, potassium salt	E378
Iodic acid, manganese salt (aqueous)	
+ iodic acid, potassium salt	E379, 399
Iodic acid, neodymium salt (aqueous)	
+ iodic acid	E271, 311, E471, 487, 488
+ iodic acid, lithium salt	E271, 311
+ iodic acid, rubidium salt	E430, 442
+ iodic acid, potassium salt	E379, 404
Iodic acid, nickel salt (aqueous)	
+ iodic acid, potassium salt	E379, 401
Iodic acid, potassium salt	
+ ammonia	420 - 426
+ ammonium chloride	424
+ hydrazine	427
+ methanol	417, 418
+ 6,7,9,10,17,18,20,21-octahydrodibenzo[b,k]- [1,4,7,10,13,16]hexaoxacyclooctadecin	418
+ potassium bromide	425
+ potassium chloride	421, 422
+ potassium iodide	426

Iodic acid, potassium salt	
+ sodium chloride	423
+ 1,1-sulfinylbismethane	419
+ water	E374-E382, 383-416
+ water-d2	387
Iodic acid, potassium salt (aqueous)	
+ chloric acid, potassium salt	145, 146, E380
+ N,N-dimethylformamide	414, 415
+ 1,4-dioxane	E378, 412
+ disodium (I-4), tetroxomolybdate (2-)	E380, 403
+ ethanol	411
+ glycine	413

+ iodic acid, neodymium salt	E379, 404
+ iodic acid, nickel salt	E379, 401
+ iodic acid, rubidium salt	E378, 395, E430
+ iodic acid, sodium salt	E335, 366, E378
+ iodic acid, zinc salt	E378, 402
+ lithium hydroxide	E273, 325-327, E380
+ nitric acid, potassium salt	E380, 388, 389
+ potassium bromide	E379, 392, 393
+ potassium chloride	E379, 391
+ potassium hydroxide	E273, 325-327, E380, 405, 406, 409, 410
+ potassium iodide	E379, E380, 394, 409, 410
+ 1,1-sulfinylbismethane	416
+ sulfuric acid, potassium salt	E380, 390
Iodic acid, rubidium salt	
+ methanol	447
+ 6,7,10,17,18,20,21-octahydrodibenzo[b,k]- [1,4,7,10,13,16]hexaoxacyclooctadecin	447
+ water	E428-E431, 432-447
Iodic acid, rubidium salt (aqueous)	
+ N,N-dimethylformamide	444, 445
+ iodic acid	E428, E430, 443, E467
+ iodic acid, aluminium salt	E430, 440
+ iodic acid, cesium salt	E430, 438, E448
+ iodic acid, hafnium salt	441
+ iodic acid, lithium salt	E270, 288-290, E428, E430
+ iodic acid, magnesium salt	E430
+ iodic acid, neodymium salt	E430, 442
+ iodic acid, potassium salt	E378, 395, E430
+ iodic acid, sodium salt	E335, 367, E430
+ iodic acid, zinc salt	E430, 439
+ nitric acid	E428, 435
+ nitric acid, potassium salt	E428, 436
+ rubidium hydroxide	E428, E430, 437
+ 1,1-sulfinylbismethane	446
Iodic acid, samarium salt (aqueous)	
+ iodic acid, lithium salt	E271, 312
Iodic acid, scandium salt (aqueous)	
+ iodic acid	E471, 484, 485
Iodic acid, silver salt (aqueous)	
+ iodic acid, lithium salt	E271, E272, 297
Iodic acid, sodium salt	
+ methanol	373
+ 6,7,10,17,18,20,21-octahydrodibenzo[b,k]- hexaoxacyclooctadecin	373
+ water	E330-E339, 340-372

Iodic acid, sodium salt (aqueous)	
+ carbonic acid, disodium salt	E337, E338, 344, 345
+ chloric acid, sodium salt	65, 66, E337, E338
+ disodium (I-4) tetroxomolybdate (2-)	E337, 343
+ iodic acid	E335, 371, 372, E467
+ iodic acid, aluminium salt	E335, 369
+ iodic acid, calcium salt	E335
+ iodic acid, cesium salt	E335, 368, E448
+ iodic acid, hafnium salt	E335, 370
+ iodic acid, lithium salt	E270, 285, E335
+ iodic acid, magnesium salt	E335, E430
+ iodic acid, potassium salt	E335, 366, E378
+ iodic acid, rubidium salt	E335, 367, E430
+ nitric acid, sodium salt	E336, E337, 346-353
+ sodium bromide	E335, E336, 359-363
+ sodium chloride	E335, E336, 357, 358
+ sodium iodide	E335, E336, 364, 365
+ sulfuric acid, sodium salt	E337, 354-356
Iodic acid, strontium salt (aqueous)	
+ iodic acid	E471
Iodic acid, thallium salt (aqueous)	
+ iodic acid, lithium salt	E271, 304
Iodic acid, titanium salt (aqueous)	
+ iodic acid, lithium salt	E271, E272, 305, 306
Iodic acid, zinc salt (aqueous)	
+ iodic acid	E471, 482
+ iodic acid, rubidium salt	E430, 439
+ iodic acid, potassium salt	E379, 402
Iodic acid, zirconium salt (aqueous)	
+ iodic acid, lithium salt	E271, 307
Iodine pentoxide	
+ sulfuric acid	E470, 479, 480
Lithium bromate	see bromic acid, lithium salt
Lithium bromide (aqueous)	
+ iodic acid, lithium salt	E272, 283
Lithium chlorate	see chloric acid, lithium salt
Lithium chloride (aqueous)	
+ chloric acid, lithium salt	E4, 20-22
+ iodic acid, lithium salt	E271, E272, 282
Lithium chloride (in ethanol)	
+ bromic acid, potassium salt	254
Lithium hydroxide (aqueous)	
+ potassium hydroxide	E273, 325-327, E380
+ iodic acid, lithium salt	E270, E272, 313, E380
+ iodic acid, potassium salt	E380
Lithium iodate	see iodic acid, lithium salt
Lithium iodide (aqueous)	
+ iodic acid, lithium salt	E272, 284
Lithium (I-4)-tetraoxorhenate (1-) (aqueous)	
+ iodic acid, lithium salt	E272, 310
D-Mannitol (aqueous)	
+ bromic acid, potassium salt	245
Methane, 1,1-sulfinylbis-	
+ iodic acid, potassium salt	419
Methane, 1,1-sulfinylbis- (aqueous)	
+ iodic acid, cesium salt	460
+ iodic acid, rubidium salt	446
+ iodic acid, potassium salt	416
Methanol	
+ iodic acid, potassium salt	417, 418
+ iodic acid, rubidium salt	447
+ iodic acid, sodium salt	373
+ 6,7,10,17,18,20,21-octahydrodibenzo[b,k]- [1,4,7,10,13,16]hexaoxacyclooctadecin	373, 418, 477
Methanol (aqueous)	
+ bromic acid, potassium salt	243
Methyl acetate	see acetic acid, methylester
Monoethanolamine	see ethanol, 2-amino-

Nitric acid		
	+ iodic acid	E470, 475-477
	+ iodic acid, rubidium salt	E428, 435
Nitric acid, calcium salt (aqueous)		
	+ chloric acid, sodium salt	78
Nitric acid, cesium salt (aqueous)		
	+ iodic acid, cesium salt	E448, 454
Nitric acid, lithium salt (aqueous)		
	+ iodic acid, lithium salt	E272, 294, 295
Nitric acid, potassium salt (aqueous)		
	+ bromic acid, potassium salt	230
	+ chloric acid, potassium salt	122
	+ iodic acid, rubidium salt	E428, 436
	+ iodic acid, potassium salt	E380, 388, 389
Nitric acid, rubidium salt (aqueous)		
	+ chloric acid, rubidium salt	E164, 169, 170
Nitric acid, sodium salt (aqueous)		
	+ bromic acid, potassium salt	228
	+ bromic acid, sodium salt	203
	+ chloric acid, sodium salt	E30, 41
	+ iodic acid, sodium salt	E336, E337, 346-353
Perchloric acid, potassium salt (aqueous)		
	+ chloric acid, potassium salt	E109, E110, 137, 138
	+ potassium chloride	E110, 137, 138
Phenol (aqueous)		
	+ bromic acid, potassium salt	249
Phosphoric acid (aqueous)		
	+ iodic acid, lithium salt	320
	+ phosphoric acid, monolithium salt	320
Phosphoric acid, monolithium salt (aqueous)		
	+ iodic acid, lithium salt	320
	+ phosphoric acid	320
Phosphoric acid, trilitium salt (aqueous)		
	+ iodic acid, lithium salt	E272, 296
Piperidine (aqueous)		
	+ bromic acid, potassium salt	251
Potassium bromate	see bromic acid, potassium salt	
Potassium bromide (aqueous)		
	+ bromic acid, potassium salt	233-235
	+ chloric acid, potassium salt	E108, E109, 141
	+ iodic acid, potassium salt	E379, 392, 393
Potassium bromide (in liquid ammonia)		
	+ iodic acid, potassium salt	425
Potassium chlorate	see chloric acid, potassium salt	
Potassium chloride (aqueous)		
	+ bromic acid, potassium salt	232
	+ chloric acid, potassium salt	E108-E110, 125-140, E164
	+ chloric acid, rubidium salt	E164
	+ chloric acid, sodium salt	E28, 29
	+ bromic acid, potassium salt	243
	+ chloric acid, potassium salt	E108, 153
	+ chloric acid, rubidium salt	E110, 139, 140
	+ iodic acid, potassium salt	E379, 391
	+ perchloric acid, potassium salt	E110, 137, 138
	+ rubidium chloride	E110, 139, 140, E164
Potassium chloride (in liquid ammonia)		
	+ iodic acid, potassium salt	421, 423
Potassium hydroxide (aqueous)		
	+ chloric acid, potassium salt	E108, 147
	+ iodic acid, lithium salt	E272, E380
	+ iodic acid, potassium salt	E378, E380, 405, 406, 409, 410
	+ lithium hydroxide	E273, E380
	+ potassium iodide	E380, 409, 410
Potassium iodate	see iodic acid, potassium salt	
Potassium iodide (aqueous)		
	+ bromic acid, potassium salt	236
	+ chloric acid, potassium salt	E108, E109, 144
	+ iodic acid, potassium salt	E379, E380, 394, 409, 410
	+ potassium hydroxide	E380, 409, 410

Potassium iodide (in liquid ammonia)		
+ iodic acid, potassium salt		426
1,2,3-Propanetriol (aqueous)		
+ bromic acid, potassium salt		243
+ chloric acid, potassium salt	E108,	153
1-Propanol (aqueous)		
+ bromic acid, potassium salt		243
2-Propanone		
+ chloric acid, lithium salt		23
+ chloric acid, sodium salt		100
+ iodic acid, lithium salt		329
2-Propanone (aqueous)		
+ bromic acid, potassium salt		247
+ chloric acid, potassium salt	E108,	154-156
Pyridine (aqueous)		
+ bromic acid, potassium salt		251
Pyrone, dimethyl- (aqueous)		
+ bromic acid, potassium salt		252
Rubidium bromate	see bromic acid, rubidium salt	
Rubidium chlorate	see chloric acid, rubidium salt	
Rubidium chloride (aqueous)		
+ cesium chloride	E164, 174, 175,	E178
+ chloric acid, cesium salt	E164, 174, 175,	E178
+ chloric acid, rubidium salt	E110, 139, 140, E164,	
	171, 172, 174, 175,	E178
+ chloric acid, potassium salt		E164
+ chloric acid, sodium salt		E164
+ potassium chloride	E110, 139, 140,	E164
+ sodium chloride		E164
Rubidium hydroxide (aqueous)		
+ iodic acid, rubidium salt	E428, E430,	437
Rubidium iodate	see iodic acid, rubidium salt	
Samarium bromate	see bromic acid, samarium salt	
Sodium bicarbonate	see carbonic acid, monosodium salt	
Sodium bromate	see bromic acid, sodium salt	
Sodium bromide (aqueous)		
+ bromic acid, sodium salt	E196, 210-212, 216,	217
+ carbonic acid, disodium salt		216
+ carbonic acid, monosodium salt		217
+ chloric acid, sodium salt	E28, E31, E32,	61
+ iodic acid, sodium salt	E335, E336,	359-363
Sodium carbonate,	see carbonic acid, disodium salt	
Sodium chlorate	see chloric acid, sodium salt	
Sodium chloride (aqueous)		
+ bromic acid, potassium salt		229
+ bromic acid, sodium salt		208, 209
+ carbonic acid, sodium salt	E31, E32,	82
+ cesium chloride		E31, E178
+ chloric acid, cesium salt		E31, E178
+ chloric acid, potassium salt		
	E31, E108, E109,	121
+ chloric acid, rubidium salt		E31, E164
+ chloric acid, sodium salt	E28, E31, 51-58, 82-	
	84, 86-89, E164,	E178
+ chlorous acid, sodium salt		
	E31, E32, 83, 84,	86-89
+ iodic acid, sodium salt	E335, E336,	357, 358
+ potassium chloride		E31
+ rubidium chloride		E31, E164
Sodium chloride (in liquid ammonia)		
+ iodic acid, potassium salt		423
Sodium hydroxide (aqueous)		
+ chloric acid, sodium salt	E30,	42-49
Sodium hydrogen carbonate	see carbonic acid, monosodium salt	
Sodium fluoride		
+ chloric acid, sodium salt	E28, E31, E32,	50
Sodium iodate	see iodic acid, sodium salt	
Sodium iodide (aqueous)		
+ bromic acid, sodium salt		213
+ chloric acid, sodium salt	E28, E31, E32,	61
+ iodic acid, sodium salt	E335, E336,	364, 365

Sodium molybdate,	see Disodium (I-4) tetroxomolybdate (2-)	
Sulfuric acid, lithium salt (aqueous)		
+ bromic acid, lithium salt		193
+ iodic acid, lithium salt		E272, 281
Sulfuric acid, potassium salt (aqueous)		
+ bromic acid, potassium salt		231
+ chloric acid, potassium salt		122, 123
+ iodic acid, potassium salt		E380, 390
Sulfuric acid, sodium salt		
+ water		42-49
Sulfuric acid, sodium salt (aqueous)		
+ bromic acid, sodium salt		204-207
+ chloric acid, sodium salt		E30, 42-49
+ iodic acid, sodium salt		E337, 354-356
Urea (aqueous)		
+ bromic acid, potassium salt		253
+ chloric acid, sodium salt		81
Water-d2		
+ chloric acid, potassium salt		119, 120
+ iodic acid, potassium salt		387
Yttrium bromate	see bromic acid, yttrium salt	

## REGISTRY NUMBER INDEX

Page numbers preceded with E refer to evaluation texts, whereas those not preceded with E refer to compilation tables.

50-00-0	246
50-99-7	245
51-79-6	253
56-40-6	248, 413
