 Solubility Data Series: Published and Forthcoming Volumes	 327

FOREWORD

*If the knowledge is
undigested or simply wrong,
more is not better.*

The Solubility Data Series is a project of Commission V.8 (Solubility Data) of the International Union of Pure and Applied Chemistry (IUPAC). The project had its origins in 1973, when the Analytical Chemistry Division of IUPAC set up a Subcommission on Solubility Data under the chairmanship of the late Prof. A.S. Kertes. When publication of the Solubility Data Series began in 1979, the Committee became a full commission of IUPAC, again under the chairmanship of Prof. Kertes, who also became *Editor-in-Chief* of the Series. The Series has as its goal the preparation of a comprehensive and critical compilation of data on solubilities in all physical systems, including gases, liquids and solids.

The motivation for the Series arose from the realization that, while solubility data are of importance in a wide range of fields in science and technology, the existing data had not been summarized in a form that was at the same time comprehensive and complete. Existing compilations of solubility data indeed existed, but they contained many errors, were in general uncritical, and were seriously out-of-date.

It was also realized that a new series of compilations of data gave educational opportunities, in that careful compilations of existing data could be used to demonstrate what constitutes data of high and lasting quality. As well, if the data were summarized in a sufficiently complete form, any individual could prepare his or her own evaluation, independently of the published evaluation. Thus, a special format was established for each volume, consisting of individual data sheets for each separate publication, and critical evaluations for each separate system, provided sufficient data from different sources were available for comparison. The compilations and, especially, the evaluations were to be prepared by active scientists who were either involved in producing new data, or were interested in using data of high quality. With minor modifications in format, this strategy has continued throughout the Series.

In the standard arrangement of each volume, the Critical Evaluation gives the following information:

(i) A text which discusses the numerical solubility information which has been abstracted from the primary sources in the form of compilation sheets. The text concerns primarily the quality of the data, after consideration of the purity of the materials and their characterization, the experimental method used, the uncertainties in the experimental values, the reproducibility, the agreement with accepted test values, and, finally, the fitting of the data to suitable functions, along with statistical tests of the fitted data.

(ii) A set of recommended data, whenever possible, including weighted averages and estimated standard deviations. If applicable, one or more smoothing equations which have been computed or verified by the evaluator are also given.

(iii) A graphical plot of the recommended data, in the form of phase diagrams where appropriate.

The Compilation part consists of data sheets which summarize the experimental data from the primary literature. Here much effort is put into obtaining complete coverage; many good data have appeared in publications from the late nineteenth and early twentieth centuries, or in obscure journals. Data of demonstrably low precision are not compiled, but are mentioned in the Critical Evaluation. Similarly, graphical data, given the uncertainty of accurate conversion to numerical values, are

compiled only where no better data are available. The documentation of data of low precision can serve to alert researchers to areas where more work is needed.

A typical data sheet contains the following information:

- (i) list of components: names, formulas, Chemical Abstracts Registry Numbers;
- (ii) primary source of the data;
- (iii) experimental variables;
- (iv) compiler's name;
- (v) experimental values as they appear in the primary source, in modern units with explanations if appropriate;
- (vi) experimental methods used;
- (vii) apparatus and procedure used;
- (viii) source and purity of materials used;
- (ix) estimated error, either from the primary source or estimated by the compiler;
- (x) references relevant to the generation of the data cited in the primary source.

Each volume also contains a general introduction to the particular type of system, such as solubility of gases, of solids in liquids, etc., which contains a discussion of the nomenclature used, the principles of accurate determination of solubilities, and related thermodynamic principles. This general introduction is followed by a specific introduction to the subject matter of the volume itself.

The Series embodies a new approach to the presentation of numerical data, and the details continue to be influenced strongly by the perceived needs of prospective users. The approach used will, it is hoped, encourage attention to the quality of new published work, as authors become more aware that their work will attain permanence only if it meets the standards set out in these volumes. If the Series succeeds in this respect, even partially, the Solubility Data Commission will have justified the labour expended by many scientists throughout the world in its production.

January, 1989

J.W. Lorimer,
London, Canada

PREFACE

This volume presents solubility data of the halides, oxyhalides and halogen complexes of groups four and five metals of the periodic table, titanium, zirconium, hafnium, vanadium, niobium and tantalum. The literature for binary and multicomponent systems has been covered up to the end of 1986. There was a great effort to have the literature survey as complete as possible, however, the editors will be grateful to have any omissions brought to their attention.

Except for the fluorides, the binary halides are predominantly covalent compounds highly susceptible to hydrolysis. No data on the solubility of the binary metal chlorides, bromides or iodides in water exists. The solubilities of these compounds in non-aqueous solvents are included. The oxyhalides and the salts of the halogen complexes solubilities are mainly studied in water and in aqueous solutions.

Phase diagrams are included for many of the multicomponent systems. For the simple eutonic systems phase diagrams were included only in the cases where no numerical data were reported in the original document, and the phase diagrams were the sole source of information.

Only those published results that report meaningful numerical data were considered for the volume. Papers that reported qualitative results with statements like "sparingly soluble", "insoluble", etc. were not considered. Papers in which the investigators failed to specify conditions such as temperature, equilibrium time, or methods of analysis were sometimes included. They were considered for the volume either if no other data were available for the system, or if the data were published in difficult to obtain older literature. The same criteria led the compiler to include estimates from a few graphically presented results.

The volume contains data on almost two hundred systems. Relatively few of the systems were studied over common ranges of temperature by more than one laboratory. Thus the opportunity to carry out evaluations is limited, and only sixteen systems are evaluated. When an evaluation was prepared the data were first compared by plotting them graphically to observe general agreement among the values from the various publications. Regression analysis was carried out in a few cases where the agreement among the various groups of investigators seemed to be good, using various polynomial functions. This was not done for systems where the data from different laboratories differed considerably and the reasons for the discrepancies were not clear.

The editors gratefully acknowledge advice and comments from members of the IUPAC Commission on Solubility Data, particularly the Chairman, Professor A. S. Kertes and the Coordinator for Solid/Liquid Systems, Dr. Mark Salomon. We thank Dr. Kurt Loening, Chemical Abstracts Service for providing Chemical Abstracts Registry Numbers. We thank Ms. Laura Johnson and Ms. Carolyn Dowie for typing the final camera ready manuscript.

The editors acknowledge the cooperation of the American Chemical Society, VAAP, the copyright agency of the USSR, and Pergamon Press for their permission to reproduce figures from their publications.

1987, October

A check of *Chemical Abstracts* through 1988, June did not find any additional papers on the solubility of these systems.

1989, January

AVIEZER STEVAN KERTES

May 11, 1922 - July 8, 1988

Professor of Chemistry

The Hebrew University
of Jerusalem

THE SCIENTIFIC CAREER OF AVIEZER STEVAN KERTES: A PERSONAL APPRECIATION

Aviezer Stevan Kertes, known as Steve to his friends outside Israel, was a leading figure in the community of researchers on solvent extraction chemistry and the initiator and leader of the Solubility Data Project of IUPAC. He left us suddenly on July 8, 1988 at the age of sixty-six, in the midst of what were always hectic but highly efficient activities in his many fields of endeavor.

Steve Kertes was born in Szeged, Hungary, near the Yugoslav border, on May 11, 1922. This circumstance led to his fluency in both Hungarian and Serbian, to which languages he added in due course French, English and Hebrew. His scientific and technological education began at the University of Belgrade in Yugoslavia, where he obtained his M.S. degree in chemical technology in 1949. In this year he emigrated to Israel, where in Jerusalem he started and conducted his scientific career, except for a postdoctoral fellowship, periods of sabbatical leave and summer vacations spent at various institutes all over the world.

As a result of his training in chemical technology, Steve started his career at the laboratories of the Dead Sea Works, Ltd. which at that time were located in temporary accommodations in Jerusalem. It was also at this time that I first made his acquaintance, which slowly grew into a lasting friendship. In 1950 Steve quit that job and enrolled as a doctoral student at the Hebrew University of Jerusalem, under the supervision of the late Prof. Mordecai Max Bobtelsky. His Ph.D. thesis dealt with metal superphosphates and their complexes, and made extensive use of a solubility method. Later on, although Steve did not value his thesis greatly, he returned to the general problem of solubility with contributions of large scale and enormous impact. He obtained his doctoral degree in 1953, and continued for a time as an assistant in Prof. Bobtelsky's department.

The scientific career of Steve Kertes really took off once he accepted a postdoctoral fellowship with Prof. Michael Lederer at the Institut du Radium in Paris, where he stayed from 1955 to 1957. He learned there the use of radioactive tracers and came into contact with radiochemistry and nuclear technology, areas with which he maintained contact in later years. Steve's research in Paris concerned the use of paper chromatography for the study of metal complexes in aqueous organic - mineral acid solutions. When he was appointed a lecturer at the Hebrew University in Jerusalem in 1957 he continued this kind of research for some time with his first graduate student, Anna Beck.

Soon Steve decided that the key to the understanding of metal complexation in aqueous organic - mineral acid solutions was a deep knowledge of the physical chemistry of these solvent systems. He therefore started a series of studies with his wife, Vera, and graduate students Anna Beck, Jacob Elhanan-Habousha and Mordecai Halpern that dealt with these systems, in particular those in which the organic solvent was tri-*n*-butyl phosphate. This solvent, of prime importance in the reprocessing of spent nuclear fuel, was at that time under intensive study all over the world, but Steve found important aspects that became his domain, in particular the formation of three liquid phases in systems involving it. To be sure, this again is a solubility phenomenon, a subject that was not left alone by Steve throughout his career. Besides three-phase formation, Steve's team also studied the properties of extraction systems with tri-*n*-butyl phosphate and its degradation product, di-*n*-butyl phosphate, as applied to hydrochloric, hydrobromic, and perchloric acids, uranyl chloride and perrhenate salts. With these studies Steve joined the community of researchers dealing with solvent extraction, and he eventually became a leader in this community.

Extraction by means of these phosphate esters occupied Steve's attention during the late 1950's, but in the early 1960's he turned towards a new class of extractants: long-chain substituted ammonium salts. By 1962 a few publications with his students and coworkers Anna Beck, Jacob Elhanan-Habousha and Isaac Platzner concerned these extractants. At that time, I was doing radiochemical research at the Soreq Nuclear Research Center, and contact between Steve and myself was renewed, with far-reaching consequences.

In 1962 Steve went for his first sabbatical leave, which he spent at M.I.T. in Cambridge, Massachusetts with John W. Irvine, staying there till 1964. That was the time when Steve began to forge lasting friendships with a great number of colleagues whom he met at M.I.T. or elsewhere in the United States. These friendships later helped him to find collaborators for the Solubility Data Project and to find places to spend summer vacations where he could engage in scientific activities with others besides his students and colleagues in Jerusalem. His chemical research at M.I.T. concerned long-chain substituted ammonium salts in nonpolar organic diluents, a subject that continued to be in the center of his interest all through the 1960's.

The collaboration between Steve Kertes and myself crystallized in 1962 with a contract with John Wiley & Sons Ltd., then in London, to write a monograph on *Ion Exchange and Solvent Extraction of Metal Complexes*. This task took us more than four years, and it was not until February, 1967 that we could take out our wives for a dinner to celebrate having sent the completed manuscript to the publisher. These years were not easy for us. I was appointed in 1965 as a professor at the Hebrew University and became the head of the department at which Steve taught. There were periods of despair and tensions between us, but our satisfaction with the finished work - a book of 1050 pages published in 1969 - and with the impact it had on the scientific community overcame them all. Our names became household words in all the laboratories where ion exchange or solvent extraction were used to separate metal ions, and we received numerous invitations to lecture at conferences, symposia, universities and research institutes. Steve's contributions to our book were essential to its success and to the impact it had, so that my own career was much enhanced by this partnership with him. When Steve Kertes returned in 1964 from M.I.T. to his position in Jerusalem he dealt throughout the remaining 1960's and the early 1970's, together with his graduate students George Y. Markovits, Oscar Levy and Hilda Gutmann, with the behavior of long-chain substituted ammonium salts in organic solvents and in particular with their aggregation. A wide variety of physico-chemical methods served for this purpose. X-rays were used for structure determination of the solid salts (in collaboration with Prof. I. Mayer) and studies of their infrared spectra established their hydrogen-bonding properties. The viscosity, conductivity, dielectric constant and in particular the vapor pressure, measured by a thermal osmometric method, helped to elucidate the aggregation of these substances in solution. A long series of publications reported on these studies.

Steve's diversity of interests were shown during another sabbatical leave in 1968/69 with Dr. Leonard Katzin at the Argonne National Laboratory in Argonne, Illinois, where he also collaborated with Dr. John Ferraro in studies of some chelate complexes. With another graduate student, Freddy Kassierer, he studied at that time the synergistic extraction with chelating extractants, and he also collaborated on this subject with Dr. Mendel Zangen of the Soreq Nuclear Research Center in Israel. The late 1960's and early 1970's constituted the peak of Steve's activities in the field of solvent extraction chemistry. He co-organized with me ISEC '68 (the 1968 International Solvent Extraction Conference) in Jerusalem and we co-edited its proceedings. At ISEC '74 in Lyon, France, he was elected to the international steering committee for these series of conferences, a position he held till 1986. His many contributions to this field were further recognized with a citation of merit at the ISEC '83 in Denver, Colorado, and finally, but alas posthumously, with the Carl Hanson medal at the recent ISEC '88 in Moscow.

The early 1970's were also an extremely fruitful period of Steve's research with his graduate students. Hilda Gutmann completed her work on the aggregation of long-chain substituted amines and their salts in non-polar solvents, and she and Steve arrived at quite unconventional conclusions. These were that in these systems aggregation proceeded to yield a series of rather small oligomers, and that neither inverted micelles were formed, nor was the concept of critical micelle concentration valid for them. Fernanda Grauer and Liliane Tsimering measured, under Steve's supervision, the heats of mixing and dissolution of extractants in various diluents by means of precise calorimetry, and contributed thereby a new dimension to the thermodynamics of solvent extraction. Steve's summer-long stay in 1970 with Prof. Robert Guillaumont in his radiochemical laboratory of the University of Paris in Orsay brought him into contact with the field of molten salt chemistry. He then collaborated with Dr. Zangen at Soreq in the supervision of another graduate student, Judith David-Auslaender, studying extraction from molten salts with organic solvents. In another summer, 1977, at the City University of New York with Prof. Harmon Finston, Steve participated in work on the homogeneous liquid-liquid extraction of metal thenoyltrifluoroacetates. Again, the diversity of Steve's interests and his ability to collaborate with others are hereby exemplified.

All through the 1970's publications appeared in the field of solvent extraction chemistry by Steve with his students and former students Markovits, Levy, Gutmann, Grauer and Tsimering. However, his main interest was diverted in the early 1970's in other directions. Two factors contributed mainly to this development. One arose from the work on the long-chain amines and the question of their micellization, the other from his election in 1967 to the Commission on Equilibrium Data of IUPAC (the International Union of Pure and Applied Chemistry), to deal initially with liquid-liquid distribution constants. The work on the aggregation and eventual micellization of the salts of long-chain substituted amines led naturally to Steve's interest in colloid chemistry, surface active substances, and microemulsions. The summer of 1973 that he spent in the Institute for Surface Chemistry in Stockholm and the subsequent sabbatical leave as a visiting professor during 1973/74 in McGill University in Montreal, Canada consolidated Steve's interaction with these fields that were up to then new to him. As a consequence he was able to act as a consultant in an industrial firm, Armac in Chicago, where he spent another sabbatical leave in 1979/80. The questions that he dealt with concerned soaps, that is, salts of long-chain carboxylic acids, in non-polar or in aqueous-organic solvents. Other problems that he investigated concerned the formation of inverted micelles and microemulsions in systems involving polar solvents (short-chain alcohols), water, salts and nonpolar organic substances (solvents) that could be solubilized in such systems. Experimental studies on such systems were conducted in his laboratory by Lilian Tsimering (in collaboration with Prof. N. Garti of the Hebrew University) and a new graduate student, Wen-Chao Lai, in the late 1970's and early 1980's. Steve's stay in the summer of 1982 at Drexel University in Philadelphia was in this connection. His reputation in this field caused him to be nominated to the editorial boards of two scientific journals in the fields of colloid and surface chemistry, and to his chairing the 4th International Conference on Surface and Colloid Science in Jerusalem in 1981.

After election to IUPAC's Commission on Equilibrium Data in 1967, Steve started on projects of compilation and critical evaluation of equilibrium constants pertinent to solvent extraction together with Dr. Eytan Yanir and myself. He soon realized the importance of accurate data and their efficient transfer from the primary scientific literature to secondary and tertiary sources. He therefore found his way to CODATA (Committee on Data for Science and Technology), and became in 1972 a member and, since 1977, the chairman of the Israel National Committee for CODATA. This activity culminated in the organization by Steve of the 9th International CODATA Conference in Jerusalem in 1984, and his acting as its chairman. He continued with work for CODATA as a member of its task groups on the accessibility and dissemination of data and of education in the use of data. Within the IUPAC Commission on Equilibrium Data (Commission V.6) Steve sought for an activity that would fit his abilities and interests but would also have far-reaching consequences. He came to the conclusion that existing data on *solubilities*, which are fundamental not only to chemistry and chemical technology but also to many other branches of science and engineering, were in poor shape, being neither comprehensive nor particularly reliable. He therefore proposed to the Commission on Equilibrium Data of IUPAC that it should engage in a project of compilation and critical evaluation of solubility data. This proposal led to the creation within the commission in 1971 of a task group (consisting first of D.N. Hume, A.S. Kertes and F.J.C. Rossotti; later G.H. Nancollas replaced F.J.C. Rossotti). This task group examined the feasibility of such a project, and recommended that the Commission should undertake it under a subcommittee of Commission V.6. This was, indeed, authorized by IUPAC in 1973, and Subcommittee V.6.1, under the chairmanship of Steve Kertes, was created.

The task of Subcommittee V.6.1 was to formulate the scope of the project, establish the mechanism of the work of compilation and evaluation, define the format of the output, and find the means for its publication. Steve was the ideal person to handle both the organizational and scientific details of this task. His superb social qualifications permitted him to enlist hundreds of volunteers to work on the *Solubility Data Project*. He was very particular regarding who would be qualified to help. He wanted professional chemists who had experience in chemical research involving solubilities and had a stake in the accuracy of such data. Such people would naturally have interests in restricted areas of the whole field of solubility, and this meant that the project would have to be subdivided into many small sub-tasks. The overall picture would then be in the hands of topic editors and the editor-in-chief. Extended guidelines were prepared for compilers and evaluators, and sample compilations and evaluations were solicited from highly qualified colleagues. The scientific organization in topics and sub-topics was agreed on in many meetings, both at IUPAC General Assemblies and otherwise. In this connection, Steve stayed for a summer with Prof. Larry Clever at Emory University in Atlanta, Georgia. The onerous task of finding a publisher for the project fell to Steve, who travelled far and wide and had discussions with numerous potential publishers till one was found that finally took upon itself the financial risks (and eventual profits), Pergamon Press of Oxford, UK.

Thus, as in 1979 the first volumes of the *Solubility Data Project* were published, the time was ripe to remove the project from under the auspices of Commission V.6, and IUPAC authorized the creation of the new full-fledged Commission on Solubility, V.8, under the chairmanship of Steve Kertes. According to IUPAC's rules Steve had to relinquish this chairmanship after eight years, in 1987, and this retirement was celebrated at a memorable dinner at the Boston General Assembly of IUPAC. Steve retained the position of Editor-in-Chief, and within IUPAC's Analytical Chemistry Division Committee, to which he was elected in 1987, he continued to make Commission V.8 aware of his concerns and to provide it with advice. By now 40 volumes of the *Solubility Data Project* have been published, and more are in various stages of preparation, the project being viable and of lasting value and service to the chemical and other scientific communities.

Steve Kertes was also instrumental in calling into being a new series of international conferences, the *International Symposia on Solubility Phenomena*, the third of which took place in Guildford, UK after Steve's death. But while most of Steve's seemingly unlimited energy was channeled into organizational and editorial activities, he did not relinquish original scientific research in the field towards which most of his career was directed: *solvent extraction chemistry*. The opportunity for this arose from Steve's last sabbatical leave, which he spent with Prof. C. Judson King at the University of California in Berkeley in 1984/85, plus an additional summer in 1987. He supplemented Prof. King, who was busy with administrative duties, as the supervisor and counsellor of a number of graduate students. The team studied the solvent extraction of organic solutes from aqueous solutions, and two review articles by King and Kertes appeared in Steve's lifetime, one on the extraction of carboxylic acids and the other on the extraction of alcohols. The original research results will have to be published without Steve's very critical and painstaking evaluation. A further aspect of solvent extraction to which Steve returned in recent years was the behavior of tri-*n*-butyl phosphate as an extractant of acids, a subject that he studied experimentally some thirty years previously, and which was the subject of a volume that Steve co-edited a few years ago.

The very active career in science pursued by Steve Kertes, consisting of a harmonious mixture of teaching, original research in solvent extraction and surface chemistry, and organizational and editing activities, particularly in the field of solubilities, did not seem to affect Steve's health or diminish his energies. Despite quitting smoking a few years ago, he did suffer from shortness of breath, but otherwise did not appear to be approaching the age of retirement from his professorship at the Hebrew University or from his numerous other activities. He was full of plans for the near and far future, ranging from what he was going to do at the Catholic University of Leuven during his visit with Prof. Pierre Huyskens this past summer and his invited contributions to the ISEC '88 in Moscow and the 26th ICCS (International Conference on Coordination Chemistry) in Porto, Portugal, to his research with graduate students in Berkeley plus other old and new projects. These plans will never be realized now, and the scientific community of which he was such an active member will have to learn to do without him.

But it is not only projects that Steve's early demise leaves unfinished, nor not only colleagues that it leaves without a dedicated collaborator. Steve left Vera, his wife and lifelong companion and helper on voyages around the world, his daughter Tamar and son Amnon and their spouses and his two grandchildren in want of a devoted husband, father and grandfather. He left his very numerous friends on all continents the memory of a man of a charming and warm personality, who would always stand by them with advice and help if need be. Steve Kertes has left his mark not only on the fields of science in which he was active, but also on the minds and hearts of all of us, his friends.

INTRODUCTION TO THE SOLUBILITY OF SOLIDS IN LIQUIDS

Nature of the Project

The Solubility Data Project (SDP) has as its aim a comprehensive search of the literature for solubilities of gases, liquids, and solids in liquids or solids. Data of suitable precision are compiled on data sheets in a uniform format. The data for each system are evaluated, and where data from different sources agree sufficiently, recommended values are proposed. The evaluation sheets, recommended values, and compiled data sheets are published on consecutive pages.

Definitions

A mixture (1, 2) describes a gaseous, liquid, or solid phase containing more than one substance, when the substances are all treated in the same way.

A solution (1, 2) describes a liquid or solid phase containing more than one substance, when for convenience one of the substances, which is called the solvent, and may itself be a mixture, is treated differently than the other substances, which are called solutes. If the sum of the mole fractions of the solutes is small compared to unity, the solution is called a dilute solution.

The solubility of a substance B is the relative proportion of B (or a substance related chemically to B) in a mixture which is saturated with respect to solid B at a specified temperature and pressure. Saturated implies the existence of equilibrium with respect to the processes of dissolution and precipitation; the equilibrium may be stable or metastable. The solubility of a substance in metastable equilibrium is usually greater than that of the corresponding substance in stable equilibrium. (Strictly speaking, it is the activity of the substance in metastable equilibrium that is greater.) Care must be taken to distinguish true metastability from supersaturation, where equilibrium does not exist.

Either point of view, mixture or solution, may be taken in describing solubility. The two points of view find their expression in the quantities used as measures of solubility and in the reference states used for definition of activities, activity coefficients and osmotic coefficients.

The qualifying phrase "substance related chemically to B" requires comment. The composition of the saturated mixture (or solution) can be described in terms of any suitable set of thermodynamic components. Thus, the solubility of a salt hydrate in water is usually given as the relative proportion of anhydrous salt in solution, rather than the relative proportions of hydrated salt and water.

Quantities Used as Measures of Solubility

1. Mole fraction of substance B, x_B :

$$x_B = n_B / \sum_{s=1}^C n_s \quad [1]$$

where n_s is the amount of substance of s , and c is the number of distinct substances present (often the number of thermodynamic components in the system). Mole per cent of B is $100 x_B$.

2. Mass fraction of substance B, w_B :

$$w_B = m_B' / \sum_{s=1}^C m_s' \quad [2]$$

where m_s' is the mass of substance s . Mass per cent is $100 w_B$. The equivalent terms weight fraction and weight per cent are not used.

3. Solute mole (mass) fraction of solute B (3, 4):

$$x_{s,B} = m_B / \sum_{s=1}^C m_s = x_B / \sum_{s=1}^C x_s \quad [3]$$

$$w_{s,B} = m_B' / \sum_{s=1}^C m_s' = w_B / \sum_{s=1}^C w_s \quad [3a]$$

where the summation is over the solutes only. For the solvent A, $x_{S,A} = x_A/(1 - x_A)$, $w_{S,A} = w_A/(1 - w_A)$. These quantities are called Jänecke mole (mass) fractions in many papers.

4. Molality of solute B (1, 2) in a solvent A:

$$m_B = n_B/n_A M_A \quad \text{SI base units: mol kg}^{-1} \quad [4]$$

where M_A is the molar mass of the solvent.

5. Concentration of solute B (1, 2) in a solution of volume V:

$$c_B = [B] = n_B/V \quad \text{SI base units: mol m}^{-3} \quad [5]$$

The symbol c_B is preferred to $[B]$, but both are used. The terms molarity and molar are not used.

Mole and mass fractions are appropriate to either the mixture or the solution point of view. The other quantities are appropriate to the solution point of view only. Conversions among these quantities can be carried out using the equations given in Table 1-1 following this Introduction. Other useful quantities will be defined in the prefaces to individual volumes or on specific data sheets.

In addition to the quantities defined above, the following are useful in conversions between concentrations and other quantities.

6. Density: $\rho = m/V$ SI base units: kg m^{-3} [6]

7. Relative density: d ; the ratio of the density of a mixture to the density of a reference substance under conditions which must be specified for both (1). The symbol d_t will be used for the density of a mixture at $t^\circ\text{C}$, 1 bar divided by the density of water at $t^\circ\text{C}$, 1 bar. (In some cases 1 atm = 101.325 kPa is used instead of 1 bar = 100 kPa.)

8. A note on nomenclature. The above definitions use the nomenclature of the IUPAC Green Book (1), in which a solute is called B and a solvent A. In compilations and evaluations, the first-named component (component 1) is the solute, and the second (component 2 for a two-component system) is the solvent. The reader should bear these distinctions in nomenclature in mind when comparing nomenclature and theoretical equations given in this Introduction with equations and nomenclature used on the evaluation and compilation sheets.

Thermodynamics of Solubility

The principal aims of the Solubility Data Project are the tabulation and evaluation of: (a) solubilities as defined above; (b) the nature of the saturating phase. Thermodynamic analysis of solubility phenomena has two aims: (a) to provide a rational basis for the construction of functions to represent solubility data; (b) to enable thermodynamic quantities to be extracted from solubility data. Both these are difficult to achieve in many cases because of a lack of experimental or theoretical information concerning activity coefficients. Where thermodynamic quantities can be found, they are not evaluated critically, since this task would involve critical evaluation of a large body of data that is not directly relevant to solubility. The following is an outline of the principal thermodynamic relations encountered in discussions of solubility. For more extensive discussions and references, see books on thermodynamics, e.g., (5-12).

Activity Coefficients (1)

(a) Mixtures. The activity coefficient f_B of a substance B is given by

$$RT \ln (f_B x_B) = \mu_B - \mu_B^* \quad [7]$$

where μ_B^* is the chemical potential of pure B at the same temperature and pressure. For any substance B in the mixture,

$$\lim_{x_B \rightarrow 1} f_B = 1 \quad [8]$$

(b) Solutions.

(1) Solute B. The molal activity coefficient γ_B is given by

$$RT \ln (\gamma_B m_B) = \mu_B - (\mu_B - RT \ln m_B)^\infty \quad [9]$$

where the superscript ∞ indicates an infinitely dilute solution. For any solute B,

$$\gamma_B^\infty = 1 \quad [10]$$

Activity coefficients y_B connected with concentrations c_B , and $f_{x,B}$ (called the rational activity coefficient) connected with mole fractions x_B are defined in analogous ways. The relations among them are (1, 9), where ρ^* is the density of the pure solvent:

$$f_B = (1 + M_A \sum_S m_S) \gamma_B = [\rho + \sum_S (M_A - M_S) c_S] y_B / \rho^* \quad [11]$$

$$\gamma_B = (1 - \sum_S x_S) f_{x,B} = (\rho - \sum_S M_S c_S) y_B / \rho^* \quad [12]$$

$$y_B = \rho^* f_{x,B} [1 + \sum_S (M_S / M_A - 1) x_S] / \rho = \rho^* (1 + \sum_S m_S) \gamma_B / \rho \quad [13]$$

For an electrolyte solute $B = C_{\nu+} A_{\nu-}$, the activity on the molality scale is replaced by (9)

$$\gamma_B m_B = \gamma_{\pm}^{\nu} m_B^{\nu} Q^{\nu} \quad [14]$$

where $\nu = \nu_+ + \nu_-$, $Q = (\nu_+^{\nu_+} \nu_-^{\nu_-})^{1/\nu}$, and γ_{\pm} is the mean ionic activity coefficient on the molality scale. A similar relation holds for the concentration activity, $y_B c_B$. For the mole fractional activity,

$$f_{x,B} x_B = Q^{\nu} f_{\pm}^{\nu} x_{\pm}^{\nu} \quad [15]$$

where $x_{\pm} = (x_+ x_-)^{1/\nu}$. The quantities x_+ and x_- are the ionic mole fractions (9), which are

$$x_+ = \nu_+ x_B / [1 + \sum_S (\nu_S - 1) x_S]; \quad x_- = \nu_- x_B / [1 + \sum_S (\nu_S - 1) x_S] \quad [16]$$

where ν_S is the sum of the stoichiometric coefficients for the ions in a salt with mole fraction x_S . Note that the mole fraction of solvent is now

$$x_A' = (1 - \sum_S \nu_S x_S) / [1 + \sum_S (\nu_S - 1) x_S] \quad [17]$$

so that

$$x_A' + \sum_S \nu_S x_S = 1 \quad [18]$$

The relations among the various mean ionic activity coefficients are:

$$f_{\pm} = (1 + M_A \sum_S \nu_S m_S) \gamma_{\pm} = [\rho + \sum_S (\nu_S M_A - M_S) c_S] y_{\pm} / \rho^* \quad [19]$$

$$\gamma_{\pm} = \frac{(1 - \sum_S x_S) f_{\pm}}{1 + \sum_S (\nu_S - 1) x_S} = (\rho - \sum_S M_S c_S) y_{\pm} / \rho^* \quad [20]$$

$$y_{\pm} = \frac{\rho^* [1 + \sum_S (M_S / M_A - 1) x_S] f_{\pm}}{\rho [1 + \sum_S (\nu_S - 1) x_S]} = \rho^* (1 + \sum_S m_S) \gamma_{\pm} / \rho \quad [21]$$

(11) Solvent, A:

The osmotic coefficient, ϕ , of a solvent A is defined as (1):

$$\phi = (\mu_A^* - \mu_A) / RT M_A \sum_S m_S \quad [22]$$

where μ_A^* is the chemical potential of the pure solvent.

The rational osmotic coefficient, ϕ_x , is defined as (1):

$$\phi_x = (\mu_A - \mu_A^*) / RT \ln x_A = \phi M_A \sum_S m_S / \ln(1 + M_A \sum_S m_S) \quad [23]$$

The activity, a_A , or the activity coefficient, f_A , is sometimes used for the solvent rather than the osmotic coefficient. The activity coefficient is defined relative to pure A, just as for a mixture.

For a mixed solvent, the molar mass in the above equations is replaced by the average molar mass; i.e., for a two-component solvent with components J, K, M_A becomes

$$M_A = M_J + (M_K - M_J) x_{v,K} \quad [24]$$

where $x_{v,K}$ is the solvent mole fraction of component K.

The osmotic coefficient is related directly to the vapor pressure, p , of a solution in equilibrium with vapor containing A only by (12, p.306):

$$\phi M_A \sum_S \nu_S m_S = - \ln(p/p_A^*) + (V_{m,A}^* - B_{AA})(p - p_A^*) / RT \quad [25]$$

where p_A^* , $V_{m,A}^*$ are the vapor pressure and molar volume of pure solvent A, and B_{AA} is the second virial coefficient of the vapor.

The Liquid Phase

A general thermodynamic differential equation which gives solubility as a function of temperature, pressure and composition can be derived. The approach is similar to that of Kirkwood and Oppenheim (7); see also (11, 12). Consider a solid mixture containing c thermodynamic components i . The Gibbs-Duhem equation for this mixture is:

$$\sum_{i=1}^c x_i' (S_i' dT - V_i' dp + d\mu_i') = 0 \quad [26]$$

A liquid mixture in equilibrium with this solid phase contains c' thermodynamic components i , where $c' > c$. The Gibbs-Duhem equation for the liquid mixture is:

$$\sum_{i=1}^c x_i (S_i dT - V_i dp + d\mu_i') + \sum_{i=c+1}^{c'} x_i (S_i dT - V_i dp + d\mu_i) = 0 \quad [27]$$

Subtract [26] from [27] and use the equation

$$d\mu_i = (d\mu_i)_{T,p} - S_i dT + V_i dp \quad [28]$$

and the Gibbs-Duhem equation at constant temperature and pressure:

$$\sum_{i=1}^c x_i (d\mu_i')_{T,p} + \sum_{i=c+1}^{c'} x_i (d\mu_i)_{T,p} = 0 \quad [29]$$

The resulting equation is:

$$RT \sum_{i=1}^c x_i' (d \ln a_i)_{T,p} = \sum_{i=1}^c x_i' (H_i - H_i') dT/T - \sum_{i=1}^c x_i' (V_i - V_i') dp \quad [30]$$

where

$$H_i - H_i' = T(S_i - S_i') \quad [31]$$

is the enthalpy of transfer of component i from the solid to the liquid phase at a given temperature, pressure and composition, with H_i and S_i the partial molar enthalpy and entropy of component i .

Use of the equations

$$H_i - H_i^0 = -RT^2 (\partial \ln a_i / \partial T)_{x,p} \quad [32]$$

and

$$V_i - V_i^0 = RT (\partial \ln a_i / \partial p)_{x,T} \quad [33]$$

where superscript 0 indicates an arbitrary reference state gives:

$$RT \sum_{i=1}^c x_i' d \ln a_i = \sum_{i=1}^c x_i' (H_i^0 - H_i') dT/T - \sum_{i=1}^c x_i' (V_i^0 - V_i') dp \quad [34]$$

where

$$d \ln a_i = (d \ln a_i)_{T,p} + (\partial \ln a_i / \partial T)_{x,p} dT + (\partial \ln a_i / \partial p)_{x,T} dp \quad [35]$$

The terms involving enthalpies and volumes in the solid phase can be written as:

$$\sum_{i=1}^c x_i' H_i' = H_S^* \quad \sum_{i=1}^c x_i' V_i' = V_S^* \quad [36]$$

With eqn [36], the final general solubility equation may then be written:

$$RT \sum_{i=1}^c x_i' d \ln a_i = (H_S^* - \sum_{i=1}^c x_i' H_i^0) d(1/T) - (V_S^* - \sum_{i=1}^c x_i' V_i^0) dp/T \quad [37]$$

Note that those components which are not present in both phases do not appear in the solubility equation. However, they do affect the solubility through their effect on the activities of the solutes.

Several applications of eqn [37] (all with pressure held constant) will be discussed below. Other cases will be discussed in individual evaluations.

(a) Solubility as a function of temperature.

Consider a binary solid compound $A_n B$ in a single solvent A. There is

no fundamental thermodynamic distinction between a binary compound of A and B which dissociates completely or partially on melting and a solid mixture of A and B; the binary compound can be regarded as a solid mixture of constant composition. Thus, with $c = 2$, $x_A' = n/(n+1)$, $x_B' = 1/(n+1)$, eqn [37] becomes:

$$d \ln(a_A^n a_B) = -\Delta H_{AB}^0 d(1/RT) \quad [38]$$

where

$$\Delta H_{AB}^0 = nH_A + H_B - (n+1)H_S^* \quad [39]$$

is the molar enthalpy of melting and dissociation of pure solid A_nB to form A and B in their reference states. Integration between T and T_0 , the melting point of the pure binary compound A_nB , gives:

$$\ln(a_A^n a_B) = \ln(a_A^n a_B)_{T=T_0} - \int_{T_0}^T \Delta H_{AB}^0 d(1/RT) \quad [40]$$

(i) Non-electrolytes

In eqn [32], introduce the pure liquids as reference states. Then, using a simple first-order dependence of ΔH_{AB}^* on temperature, and assuming that the activity coefficients conform to those for a simple mixture (6):

$$RT \ln f_A = w x_B^2 \quad RT \ln f_B = w x_A^2 \quad [41]$$

then, if w is independent of temperature, eqn [32] and [33] give:

$$\ln(x_B(1-x_B)^n) + \ln\left[\frac{n^n}{(1+n)^{n+1}}\right] = G(T) \quad [42]$$

where

$$G(T) = - \left[\frac{\Delta H_{AB}^* - T^* \Delta C_p^*}{R} \right] \left[\frac{1}{T} - \frac{1}{T^*} \right] + \frac{\Delta C_p^*}{R} \ln(T/T^*) - \frac{w}{R} \left[\frac{x_A^2 + n x_B^2}{T} - \frac{n}{(n+1)T^*} \right] \quad [43]$$

where ΔC_p^* is the change in molar heat capacity accompanying fusion plus decomposition of the pure compound to pure liquid A and B at temperature T^* , (assumed here to be independent of temperature and composition), and ΔH_{AB}^* is the corresponding change in enthalpy at $T = T^*$. Equation [42] has the general form:

$$\ln(x_B(1-x_B)^n) = A_1 + A_2/(T/K) + A_3 \ln(T/K) + A_4(x_A^2 + n x_B^2)/(T/K) \quad [44]$$

If the solid contains only component B, then $n = 0$ in eqn [42] to [44].

If the infinite dilution reference state is used, then:

$$RT \ln f_{x,B} = w(x_A^2 - 1) \quad [45]$$

and [39] becomes

$$\Delta H_{AB}^\infty = nH_A^* + H_B^\infty - (n+1)H_S^* \quad [46]$$

where ΔH_{AB}^∞ is the enthalpy of melting and dissociation of solid compound A_nB to the infinitely dilute reference state of solute B in solvent A; H_A^* and H_B^∞ are the partial molar enthalpies of the solute and solvent at infinite dilution. Clearly, the integral of eqn [32] will have the same form as eqn [35], with ΔH_{AB}^∞ replacing ΔH_{AB}^* , ΔC_p^∞ replacing ΔC_p^* , and $x_A^2 - 1$ replacing x_A^2 in the last term.

See (5) and (11) for applications of these equations to experimental data.

(ii) Electrolytes

(a) Mole fraction scale

If the liquid phase is an aqueous electrolyte solution, and the solid is a salt hydrate, the above treatment needs slight modification. Using rational mean activity coefficients, eqn [34] becomes:

$$\ln \left\{ \frac{x_B^\nu (1 - x_B)^\eta}{[1 + (\nu - 1)x_B]^{n+\nu}} \right\} - \ln \left\{ \frac{n^\eta}{(n + \nu)^{n+\nu}} \right\} + \ln \left\{ \left[\frac{f_{B^*}}{T_{B^*}} \right]^\nu \left[\frac{f_{A^*}}{T_{A^*}} \right]^\eta \right\} \quad [47]$$

$$- - \left\{ \frac{\Delta H_{AB}^* - T^* \Delta C_p^*}{R} \right\} \left\{ \frac{1}{T} - \frac{1}{T^*} \right\} + \frac{\Delta C_p^*}{R} \ln(T/T^*)$$

where superscript * indicates the pure salt hydrate. If it is assumed that the activity coefficients follow the same temperature dependence as the right-hand side of eqn [47] (13-16), the thermochemical quantities on the right-hand side of eqn [47] are not rigorous thermodynamic enthalpies and heat capacities, but are apparent quantities only. Data on activity coefficients (9) in concentrated solutions indicate that the terms involving these quantities are not negligible, and their dependence on temperature and composition along the solubility-temperature curve is a subject of current research.

A similar equation (with $\nu = 2$ and without the heat capacity terms or activity coefficients) has been used to fit solubility data for some MOH-H₂O systems, where M is an alkali metal (13); enthalpy values obtained agreed well with known values. The full equation has been deduced by another method in (14) and applied to MCl₂-H₂O systems in (14) and (15). For a summary of the use of equation [47] and similar equations, see (14).

(2) Molality scale

Substitution of the mean activities on the molality scale in eqn [40] gives:

$$\nu \ln \left\{ \frac{\gamma_{\pm} m_B}{\gamma_{\pm}^* m_B^*} \right\} - \nu (m_B/m_B^* - 1) - \nu (m_B(\phi - 1)/m_B^* - \phi^* + 1) \quad [48]$$

$$= G(T)$$

where $G(T)$ is the same as in eqn [47], $m_B^* = 1/nM_A$ is the molality of the anhydrous salt in the pure salt hydrate and γ_{\pm} and ϕ are the mean activity coefficient and the osmotic coefficient, respectively. Use of the osmotic coefficient for the activity of the solvent leads, therefore, to an equation that has a different appearance to [47]; the content is identical. However, while eqn [47] can be used over the whole range of composition ($0 < x_B < 1$), the molality in eqn [48] becomes infinite at $x_B = 1$; use of eqn [48] is therefore confined to solutions sufficiently dilute that the molality is a useful measure of composition. The essentials of eqn [48] were deduced by Williamson (17); however, the form used here appears first in the *Solubility Data Series*. For typical applications (where activity and osmotic coefficients are not considered explicitly, so that the enthalpies and heat capacities are apparent values, as explained above), see (18).

The above analysis shows clearly that a rational thermodynamic basis exists for functional representation of solubility-temperature curves in two-component systems, but may be difficult to apply because of lack of experimental or theoretical knowledge of activity coefficients and partial molar enthalpies. Other phenomena which are related ultimately to the stoichiometric activity coefficients and which complicate interpretation include ion pairing, formation of complex ions, and hydrolysis. Similar considerations hold for the variation of solubility with pressure, except that the effects are relatively smaller at the pressures used in many investigations of solubility (5).

(b) Solubility as a function of composition.

At constant temperature and pressure, the chemical potential of a saturating solid phase is constant:

$$\mu_{A_n B^*} = \mu_{A_n B}(\text{sln}) = n\mu_A + \mu_B \quad [49]$$

$$= (n\mu_A^* + \nu_+ \mu_+^{\infty} + \nu_- \mu_-^{\infty}) + nRT \ln f_A^* x_A$$

$$+ \nu RT \ln(\gamma_{\pm} m_{\pm} \phi)$$

for a salt hydrate $A_n B$ which dissociates to water (A), and a salt (B), one mole of which ionizes to give ν_+ cations and ν_- anions in a solution in which other substances (ionized or not) may be present. If the saturated solution is sufficiently dilute, $f_A = x_A = 1$, and the quantity K_S in

$$\Delta G^{\infty} = (\nu_+ \mu_+^{\infty} + \nu_- \mu_-^{\infty} + n\mu_A^* - \mu_{AB}^*)$$

$$= -RT \ln K_S$$

$$= -\nu RT \ln(\gamma_{\pm} m_B) \quad [50]$$

is called the solubility product of the salt. (It should be noted that it is not customary to extend this definition to hydrated salts, but there is no reason why they should be excluded.) Values of the solubility product are often given on mole fraction or concentration scales. In dilute solutions, the theoretical behaviour of the activity coefficients as a function of ionic strength is often sufficiently well known that reliable extrapolations to infinite dilution can be made, and values of K_s can be determined. In more concentrated solutions, the same problems with activity coefficients that were outlined in the section on variation of solubility with temperature still occur. If these complications do not arise, the solubility of a hydrate salt $C_{\nu}A_{\nu} \cdot nH_2O$ in the presence of other solutes is given by eqn [50] as

$$\nu \ln\{m_B/m_B(0)\} = -\nu \ln\{\gamma_{\pm}(0)\} - n \ln\{a_A/a_A(0)\} \quad [51]$$

where a_A is the activity of water in the saturated solution, m_B is the molality of the salt in the saturated solution, and (0) indicates absence of other solutes. Similar considerations hold for non-electrolytes.

Consideration of complex mixed ligand equilibria in the solution phase are also frequently of importance in the interpretation of solubility equilibria. For nomenclature connected with these equilibria (and solubility equilibria as well), see (19, 20).

The Solid Phase

The definition of solubility permits the occurrence of a single solid phase which may be a pure anhydrous compound, a salt hydrate, a non-stoichiometric compound, or a solid mixture (or solid solution, or "mixed crystals"), and may be stable or metastable. As well, any number of solid phases consistent with the requirements of the phase rule may be present. Metastable solid phases are of widespread occurrence, and may appear as polymorphic (or allotropic) forms or crystal solvates whose rate of transition to more stable forms is very slow. Surface heterogeneity may also give rise to metastability, either when one solid precipitates on the surface of another, or if the size of the solid particles is sufficiently small that surface effects become important. In either case, the solid is not in stable equilibrium with the solution. See (21) for the modern formulation of the effect of particle size on solubility. The stability of a solid may also be affected by the atmosphere in which the system is equilibrated.

Many of these phenomena require very careful, and often prolonged, equilibration for their investigation and elimination. A very general analytical method, the "wet residues" method of Schreinemakers (22), is often used to investigate the composition of solid phases in equilibrium with salt solutions. This method has been reviewed in (23), where [see also (24)] least-squares methods for evaluating the composition of the solid phase from wet residue data (or initial composition data) and solubilities are described. In principle, the same method can be used with systems of other types. Many other techniques for examination of solids, in particular X-ray, optical, and thermal analysis methods, are used in conjunction with chemical analyses (including the wet residues method).

COMPILATIONS AND EVALUATIONS

The formats for the compilations and critical evaluations have been standardized for all volumes. A brief description of the data sheets has been given in the FOREWORD; additional explanation is given below.

Guide to the Compilations

The format used for the compilations is, for the most part, self-explanatory. The details presented below are those which are not found in the FOREWORD or which are not self-evident.

Components. Each component is listed according to IUPAC name, formula, and Chemical Abstracts (CA) Registry Number. The formula is given either in terms of the IUPAC or Hill (25) system and the choice of formula is governed by what is usual for most current users: i.e., IUPAC for inorganic compounds, and Hill system for organic compounds. Components are ordered according to:

- (a) saturating components;
- (b) non-saturating components in alphanumerical order;
- (c) solvents in alphanumerical order.

The saturating components are arranged in order according to a 18-column periodic table with two additional rows:

- Columns 1 and 2: H, alkali elements, ammonium, alkaline earth elements
- 3 to 12: transition elements
- 13 to 17: boron, carbon, nitrogen groups; chalcogenides, halogens
- 18: noble gases
- Row 1: Ce to Lu
- Row 2: Th to the end of the known elements, in order of atomic number.

Salt hydrates are generally not considered to be saturating components since most solubilities are expressed in terms of the anhydrous salt. The existence of hydrates or solvates is carefully noted in the text, and CA Registry Numbers are given where available, usually in the critical evaluation. Mineralogical names are also quoted, along with their CA Registry Numbers, again usually in the critical evaluation.

Original Measurements. References are abbreviated in the forms given by *Chemical Abstracts Service Source Index (CASSI)*. Names originally in other than Roman alphabets are given as transliterated by *Chemical Abstracts*.

Experimental Values. Data are reported in the units used in the original publication, with the exception that modern names for units and quantities are used; e.g., mass per cent for weight per cent; mol dm⁻³ for molar; etc. Both mass and molar values are given. Usually, only one type of value (e.g., mass per cent) is found in the original paper, and the compiler has added the other type of value (e.g., mole per cent) from computer calculations based on 1983 atomic weights (26).

Errors in calculations and fitting equations in original papers have been noted and corrected, by computer calculations where necessary.

Method. Source and Purity of Materials. Abbreviations used in *Chemical Abstracts* are often used here to save space.

Estimated Error. If these data were omitted by the original authors, and if relevant information is available, the compilers have attempted to estimate errors from the internal consistency of data and type of apparatus used. Methods used by the compilers for estimating and reporting errors are based on the papers by Ku and Eisenhart (27).

Comments and/or Additional Data. Many compilations include this section which provides short comments relevant to the general nature of the work or additional experimental and thermodynamic data which are judged by the compiler to be of value to the reader.

References. See the above description for Original Measurements.

Guide to the Evaluations

The evaluator's task is to check whether the compiled data are correct, to assess the reliability and quality of the data, to estimate errors where necessary, and to recommend "best" values. The evaluation takes the form of a summary in which all the data supplied by the compiler have been critically reviewed. A brief description of the evaluation sheets is given below.

Components. See the description for the Compilations.

Evaluator. Name and date up to which the literature was checked.

Critical Evaluation

(a) **Critical text.** The evaluator produces text evaluating all the published data for each given system. Thus, in this section the evaluator reviews the merits or shortcomings of the various data. Only published data are considered; even published data can be considered only if the experimental data permit an assessment of reliability.

(b) **Fitting equations.** If the use of a smoothing equation is justifiable the evaluator may provide an equation representing the solubility as a function of the variables reported on all the compilation sheets.

(c) **Graphical summary.** In addition to (b) above, graphical summaries are often given.

(d) **Recommended values.** Data are recommended if the results of at least two independent groups are available and they are in good agreement, and if the evaluator has no doubt as to the adequacy and reliability of the applied experimental and computational procedures. Data are considered as tentative if only one set of measurements is

available, or if the evaluator considers some aspect of the computational or experimental method as mildly undesirable but estimates that it should cause only minor errors. Data are considered as doubtful if the evaluator considers some aspect of the computational or experimental method as undesirable but still considers the data to have some value in those instances where the order of magnitude of the solubility is needed. Data determined by an inadequate method or under ill-defined conditions are rejected. However references to these data are included in the evaluation together with a comment by the evaluator as to the reason for their rejection.

(e) References. All pertinent references are given here. References to those data which, by virtue of their poor precision, have been rejected and not compiled are also listed in this section.

(f) Units. While the original data may be reported in the units used by the investigators, the final recommended values are reported in S.I. units (1, 28) when the data can be accurately converted.

AUXILIARY INFORMATION																																																							
METHOD/APPARATUS/PROCEDURE: Isothermal method used. To a constant amount of TiF_4 solution, increasing amounts of KF and water were added to vary the TiF_4/KF mole ratio while keeping the total mass of the mixture at 100g. K determined gravimetrically as K_2SO_4 , Ti colorimetrically, and F^- either titrimetrically with $Th(NO_3)_4$ against alizarine sulfonate or gravimetrically as CaF_2 . The composition of the solid phases was deduced from the solubility isotherm.	SOURCE AND PURITY OF MATERIALS: (1) A solution of TiF_4 prepared by reaction of TiO_2 with excess HF. Source and purity of chemicals not specified. (2) KF, reagent grade, recrystallized twice from water. ESTIMATED ERROR: Temp: precision ± 0.1 K. Soly: precision ± 5 %. REFERENCES:																																																						

COMPONENTS: (1) Titanium fluoride; TiF_4 ; [7783-63-3] (2) (OC-6-11)-Uranium flouride; UF_6 ; [7783-81-5]	ORIGINAL MEASUREMENTS: Nikolaev, N. S.; Sadikova, A. T. <i>At. Ener.</i> 1975, 39, 338-43. <i>Sov. At. Energy (Engl. Transl.)</i> 1975, 39, 338-43.
VARIABLES: $T/K = 373$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p style="text-align: center;">At 100°C the solubility of TiF_4 in UF_6 is reported to be 0.063 mol kg^{-1} (0.78 mass %).</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: <p>Isothermal method used. Solubility was determined in a Cu autoclave placed in a crucible furnace. Excess solid was equilibrated under constant mixing with 6 ml UF_6 for 30-40 h, and then allowed to stand for another 40 h which exceeded 3-4 times the time necessary to reach the equilibrium. After that the autoclave was rapidly cooled in liquid N. From the frozen sample, UF_6 was pumped off <i>in vacuo</i> at 80-90°C and Ti was determined in the residue. The method of analysis was not mentioned.</p>	SOURCE AND PURITY OF MATERIALS: <p>The fluorides were prepared by the authors. No details were specified except for the fact that the products were strictly anhydrous.</p> ESTIMATED ERROR: Temp: precision ± 5 K. Soly: precision ± 5 %. REFERENCES:

VARIABLES: $T/K = 298, 323$ Composition and HF molality	PREPARED BY: J. Hála
EXPERIMENTAL VALUES:	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. To prevent hydrolysis of the complex fluorides, the solubilities were determined in water containing 2 mass% HF. Equilibrium was attained within 3-4 h. Saturated solution and solid phases were analyzed for Ti and Nb spectrophotometrically. The samples were evaporated with H_2SO_4 to remove F^- and in the residue Ti and Nb were determined with H_2O_2 and SCN^- methods, respectively. Solid phases were also characterized by optical microscopy and the method of wet residues.	SOURCE AND PURITY OF MATERIALS: Complex fluorides were prepared by evaporation of HF solutions of the corresponding metal oxide and NH_4F in the stoichiometric ratio. The salts were 3-times recrystallized. Analysis (mass%, found/calculated): $(\text{NH}_4)_2\text{TiF}_6$, Ti 24.19/24.20, NH_4 17.95/18.18; $(\text{NH}_4)_2\text{NbOF}_5$, Nb 38.78/38.72, NH_4 14.85/15.0. Source and purity of TiO_2 , Nb_2O_5 , and other chemicals used not specified.
	ESTIMATED ERROR: Temp: precision ± 0.01 K. The solubility error is not specified

COMPONENTS:	EVALUATOR:
(1) (OC-6-11)-Dipotassium hexafluorotitanate(2-); K_2TiF_6 ; [16919-27-0]	J. Hála Department of Inorganic Chemistry J. E. Purkyne University 611 37 Brno, Czechoslovakia
(2) Water; H_2O ; [7732-18-5]	October, 1984

CRITICAL EVALUATION:

The solubility of dipotassium hexafluorotitanate(2-) in water.

The solubility of K_2TiF_6 in water has been reported in four publications (ref 1-4). Marignac (ref 1) reports six values over the 273 to 293 K temperature interval. Weiss and Kaiser (ref 2) report values at temperatures of 293 and 371 K, and the others (ref 3 and 4) report a value at one temperature each. The Marignac (ref 1) data were published in a footnote with no experimental details or precision of measurement. However, the Marignac value at 293 K is identical to the 293 K value of Ginsberg and Holder (ref 3), and in good agreement with the value of Weiss and Kaiser (ref 2). All of the available data are summarized in Table 1. The molalities were calculated from the original solubility data.

Table 1. Tentative values of the solubility of K_2TiF_6 in water.

AUXILIARY INFORMATION																						
METHOD/APPARATUS/PROCEDURE: To a flask containing a known amount of K_2TiF_6 , water was gradually added until the salt dissolved completely. Measurements at 98° were carried out in a boiling water bath in a flask equipped with a reflux condenser. Solid phase was not examined.	SOURCE AND PURITY OF MATERIALS: (1) K_2TiF_6 containing 19.79% Ti was prepared by dissolving TiO_2 in HF (reagent grade, KahIbaum). On addition of an excess of K_2CO_3 solution, K_2TiF_6 crystals were obtained. The solid was dried at $100^\circ C$. TiO_2 was prepared from Brazilian rutile by fusion with $KHSO_4$ and leaching the melt with water; it contained only traces of Fe.																					
	ESTIMATED ERROR: Nothing specified.

AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: A glass pressure vessel, in which sedimentation, decantation, and filtration of the $TiCl_2$ ammoniate could be done, was used. A small glass ampoule with $TiCl_4$, 0.2-0.3% Na amalgam containing excess Na, and NaBr was introduced into the vessel; the latter was evacuated and shaken vigorously to crush the ampoule, and then shaken slowly until all $TiCl_4$ was reduced, as indicated by no further increase in temperature. Then NH_3 gas was introduced at ordinary pressure until formation of the ammoniate was completed. The vessel was cooled, liquid NH_3 distilled into it, and the vessel kept in a thermostat for some hours with occasional shaking. Finally a portion of the saturated solution was poured out through an auxiliary glass tube with glass filter into another cooled vessel, and weighed. NH_3 was allowed to evaporate at room temp. and its content was obtained from loss	SOURCE AND PURITY OF MATERIALS: (1) $TiCl_4$ distilled in the presence of Cu powder. (2) NaBr, reagent grade, was dried at 500-600°C and treated with a solution of Na in NH_3 to remove traces of water. (3) Na-amalgam was prepared either by electrolysis of aqueous solution of NaCl or NaOH, or by direct reaction of Na metal with Hg. (4) NH_3 distilled in the presence of metallic Na. The solid phase was $TiCl_3 \cdot 6H_2O$ throughout the whole HCl concentration range. The increase in solubility at HCl concentrations above 37 mass% was ascribed to the formation of anionic complexes in the solution, e.g. $H_2[TiCl_5]$.

a. Calculated by compiler b. The mol kg^{-1} values referred to H_2O as the solvent could not be calculated since the water content in these solutions is very low and for most data points the experimental data are inconsistent (see footnote c). c. The sum ($\text{mass}\% \text{TiCl}_4 + \text{mass}\% \text{HCl}$) > 100.							
AUXILIARY INFORMATION							
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Measurements started with supersaturated solutions of TiCl_4 in ice-cooled HCl . For HCl concentrations above 36 mass%, solutions were mixed for several weeks to allow for precipitation of the equilibrium solid phase, and kept in thermostat for several days. Mixtures containing less than 16 mass% HCl were prepared from the supersaturated TiCl_4 solution by diluting it with water or dilute HCl . Since at 0°C , equilibrium state in these solutions could not be reached even after 2 months, solubility determinations at less than 16 mass% were done at 20°C . At 26-36 mass%, HCl , viscosity of the solutions was so high that the solid phase settled neither after several weeks standing nor after centrifuging at 3500 rpm. therefore the system could not be studied within this HCl concentration range. At HCl concentrations around 25% gels were obtained. Ti was determined gravimetrically as					SOURCE AND PURITY OF MATERIALS: Nothing specified.		
					ESTIMATED ERROR: Temp: precision ± 0.5 K. Soly: precision ± 5 %.		
					TiO_2 or colorimetrically with H_2O_2 , Cl^- determined by Volhard's method. Solid phases were characterized by chemical analysis and microscopy.

AUXILIARY INFORMATION																									
METHOD/APPARATUS/PROCEDURE: A glass pressure vessel, in which sedimentation, decantation, and filtration of TiCl_4 ammonate could be done, was used. A small glass ampoule with TiCl_4 and NaCl was introduced into the vessel; the latter was evacuated and shaken vigorously to crush the ampoule. Then NH_3 gas was introduced at ordinary pressure until the formation of the ammonate was completed. The vessel was then cooled, liquid NH_3 distilled into it, and the vessel was kept in a thermostat for some hours with occasional shaking until equilibrium was attained. Finally a portion of the saturated solution was poured out through an auxiliary glass tube with glass filter into another cooled vessel, and weighed. NH_3 was allowed to evaporate at room temp. and its content was obtained from loss of weight. The residue was analyzed for remaining components by standard methods.	SOURCE AND PURITY OF MATERIALS: (1) TiCl_4 purified by distillation with Cu powder. (2) NaCl , reagent grade. (3) NH_3 distilled in the presence of metallic Na . ESTIMATED ERROR: Temp: precision ± 0.5 K. Soly: precision ± 5 %. REFERENCES:

$TiCl_4 \cdot xNaBr \cdot 6NH_3$ was assumed to be the equilibrium solid phase.

a Calculated by compiler (J.H.)

b Analysis showed that the following displacement reaction takes place in solution:

$$TiCl_4 + n NaBr \rightleftharpoons TiCl_4Br_{4-x} + (4-x)NaCl + (n-4+x)NaBr.$$

With increasing NaBr concentration, x gradually diminished and NaCl precipitated. The values g $TiCl_4$ /100g NH_3 were calculated by the author assuming that only $TiCl_4$ existed in solution.

AUXILIARY INFORMATION																					
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess $TiOCl_2$ was stirred with $TiCl_4$ for at least 10 h in a thermostated bath. The equilibrium saturated solutions were transferred into a sampling vessel, weighed, $TiCl_4$ removed by vacuum distillation at 30-40 $^\circ C$, and the residue was vacuum dried and weighed. In some cases the saturated solutions were analyzed for $TiOCl_2$ content spectroscopically from the IR absorption at 1356 cm^{-1} . Preliminary experiments confirmed that $TiOCl_2$ did not change on prolonged refluxing in $TiCl_4$. A pronounced tendency of $TiOCl_2$ to form super-saturated solutions in $TiCl_4$ was mentioned.	SOURCE AND PURITY OF MATERIALS: (1) $TiOCl_2$ was prepared by partial hydrolysis of $TiCl_4$. The $TiCl_4$ was removed from the reaction mixture by vacuum distillation, and the product was vacuum dried. Its density was $\rho/g\ cm^{-3} = 2.46-2.49$, and molecular weight, as determined ebullioscopically, varied within the range 132-137; calculated 134.8. ESTIMATED ERROR: Temp: precision $\pm 1\ K$. Soly: precision $\pm 3-7\ \%$. REFERENCES:

AUXILIARY INFORMATION																																														
METHOD/APPARATUS/PROCEDURE: Saturated solutions of TiOCl_2 in TiCl_4 were prepared by reacting As_2O_3 with excess TiCl_4 in a 3-neck flask equipped with a condenser, stirrer, and a rubber stopper through which samples for analysis could be withdrawn. 150cm TiCl_4 was distilled onto 3 g As_2O_3 in the flask and TiOCl_2 precipitated out as a pale yellow solid via the reaction	SOURCE AND PURITY OF MATERIALS: Nothing specified. $\text{As}_2\text{O}_3 + 3 \text{TiCl}_4 \rightarrow \text{TiOCl}_2 + 2 \text{AsCl}_3.$ <p data-bbox="107 1391 1201 1733">AsCl_3 produced, which is miscible with TiCl_4, was not separated from the mixture and consequently all solutions contained identical concentration of AsCl_3 corresponding to the amount of As_2O_3 used. The slurry was stirred for 2-3 h at each temperature after which pressure was applied through the condenser to withdraw a 10 cm^3 sample of the saturated solution with a pipette equipped with a glass filter. All procedures were carried out with exclusion of air moisture. The samples were added dropwise to ice-cooled H_2SO_4 solution, and Ti was determined by titration with Fe(III) against KSCN indicator after reduction to Ti(III) in Jones reductor. Cl was determined by titration with AgNO_3, and As by titration with NaBrO_3. From the concentrations of Ti, Cl, and As the content of oxygen in the saturated solution was obtained by difference, and used to calculate the solubility of TiOCl_2. The equilibrium solid phase was confirmed by chemical analysis to be TiOCl_2.</p> <p data-bbox="107 1774 385 1847">ESTIMATED ERROR: Nothing specified.</p>

^b A: NH_4Cl , [12125-02-9]; B: $\text{TiCl}_3 \cdot 6\text{H}_2\text{O}$, [19114-57-9]; C: $(\text{NH}_4)_2\text{TiCl}_5 \cdot \text{H}_2\text{O}$, [107944-12-7]																																																																																																							
AUXILIARY INFORMATION																																																																																																							
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess of either $(\text{NH}_4)_2\text{TiCl}_5 \cdot \text{H}_2\text{O}$ or a mixture of NH_4Cl and $\text{TiCl}_3 \cdot 6\text{H}_2\text{O}$ was equilibrated with HCl solutions of the desired concentration at 0° in argon atmosphere for 6-8 h. Solutions with high HCl concentrations were prepared by saturating the solutions with HCl gas at 0°. In the samples of the saturated solutions and the solid phases Ti(III) was determined by titration with KMnO_4 after reacting the sample with excess $\text{KFe}(\text{SO}_4)_2$, Cl^- by Volhard method, and NH_4^+ by Kjeldahl method. To check for the presence of Ti(IV), the total Ti content was determined gravimetrically as TiO_2 . HCl concentration was determined as the difference of total Cl and the Cl content combined with Ti(III) and NH_4^+ . Solid phases were also characterized by microscopic analysis and the method of wet residues.			SOURCE AND PURITY OF MATERIALS: (1) $(\text{NH}_4)_2\text{TiCl}_5 \cdot \text{H}_2\text{O}$ was prepared by precipitation from a solution of TiCl_3 and NH_4Cl (reagent grade) in concentrated HCl at 0° by saturating the solution with HCl gas. The crystals were dried in a stream of Ar + HCl gases. Analysis, mass% (found/calculated): NH_4 12.86/12.92, Ti 17.20/17.15, Cl 63.58/63.49, H_2O -/6.44. $\text{TiCl}_3 \cdot 6\text{H}_2\text{O}$ used was prepared by dissolving Ti metal, obtained by iodide method, in concentrated HCl, and saturating the solution with HCl gas at 0°. The crystals were dried in a stream of Ar + HCl gases.																																																																																																				
			ESTIMATED ERROR: Temperature was kept within the range of 0 - 0.5°C. The solubility error is not specified.

AUXILIARY INFORMATION								
METHOD/APPARATUS/PROCEDURE:					SOURCE AND PURITY OF MATERIALS:			
Isothermal method used. Solutions containing excess solid were shaken for several hours. Solutions containing more than 37% HCl were prepared by saturating with HCl gas. Ti was determined gravimetrically as TiO ₂ or colorimetrically at low Ti concentrations, Cl ⁻ determined by Volhard's method. No method given for NH ₄ ⁺ determination. HCl content found by difference. Solid phases were identified by microscopy and chemical analysis.					(1) $(\text{NH}_4)_2\text{TiCl}_6 \cdot \text{H}_2\text{O}$ was prepared by mixing stoichiometric amounts of NH ₄ Cl and TiCl ₄ in a solution of HCl through which was passed a stream of HCl gas. The product was stored over concentrated H ₂ SO ₄ . Source and purity of chemicals not specified.

AUXILIARY INFORMATION																											
METHOD/APPARATUS/PROCEDURE: Isothermal method used. An apparatus consisting of 2 ampoules, one of which contained TiI_4 and C_6H_6 , was shaken, excess TiI_4 allowed to settle, and the saturated solution transferred in to the empty ampoule which was then cooled by liquid N. In a dry box the ampoule was attached to a vacuum line, benzene was condensed in a trap cooled with liquid N and weighed. TiI_4 was weighed as the residue in the ampoule.	SOURCE AND PURITY OF MATERIALS: (1) TiI_4 prepared by direct synthesis from Ti and I_2 , and sublimed in vacuo. Source and purity of chemicals not specified. ESTIMATED ERROR: The temperature error is not specified. Soly: precision $\pm 1-2\%$ (compiler). REFERENCES:

AUXILIARY INFORMATION													
METHOD/APPARATUS/PROCEDURE: <p>Isothermal method used. Liquid HF was mixed with excess ZrF_4 in polyethylene bottles for several days. Before mixing diluted F_2 was bubbled through the solution for 1 h to remove traces of water. Samples for analysis were taken into a teflon sampling bottle by using a hypodermic needle with a teflon adapter. The sample was weighed and evaporated to dryness in a Pt crucible. The residue, ZrF_4 was dried at 110° and weighed. The authors do not report on the composition of the solid phases.</p>	SOURCE AND PURITY OF MATERIALS: (1) ZrF_4 was prepared from HF and Zr(IV) nitrate. The purity and source of the latter were not specified. (2) HF was prepared according to Simons (ref 1) by absorbing commercial HF in molted KHF_2 . Traces of water and other impurities were removed by electrolysis, and HF was then distilled from the mixture through a Cu cooler and stored in polyethylene bottles. ESTIMATED ERROR: The temperature error is not specified. The solubility error is ± 0.002 g $ZrF_4/100$ g HF (precision). REFERENCES: 1. Simons, J.H. <i>Inorganic Synthesis</i> , Vol. 1, McGraw-Hill Book Comp., Inc., New York, <u>1939</u> , p. 134.

CRITICAL EVALUATION:

The solubility of zirconium fluoride in aqueous hydrogen fluoride.

Of the three documents which report solubility measurements of ZrF_4 as a function of HF concentration those of Hevesy and Wagner (ref 1) and Nikolaev et al. (ref 2) at 298 K can be compared. In the third paper the solubility at 0.5°C is reported (ref 3). Even a brief inspection of the molal ($m_1/mol\ kg^{-1}$) data in the compilations shows that the data of Hevesy and Wagner (1) and Nikolaev et al. (ref 2) differ greatly, those of (ref 1) being much higher especially for low HF concentration. Only the value of 3.62 mol ZrF_4/kg for 18.76 mol HF/kg (ref 1) seems to approach the solubility isotherm of Nikolaev et al. (ref 2). The reason for this discrepancy is not clear. It should be noted that the same solid was used for the solubility measurements in both studies, i.e. $ZrF_4 \cdot 3H_2O$, although Hevesy and Wagner (ref 1) gave the older formula for it ($ZrOF_2 \cdot H_2F_2 \cdot 2H_2O$) (ref 4). The sharp decrease of ZrF_4 solubility at high HF concentrations (ref 2) is in agreement with the solubility of ZrF_4 in nonaqueous HF (ref 5), i.e. 0.00054 mol kg^{-1} at 285.6K.

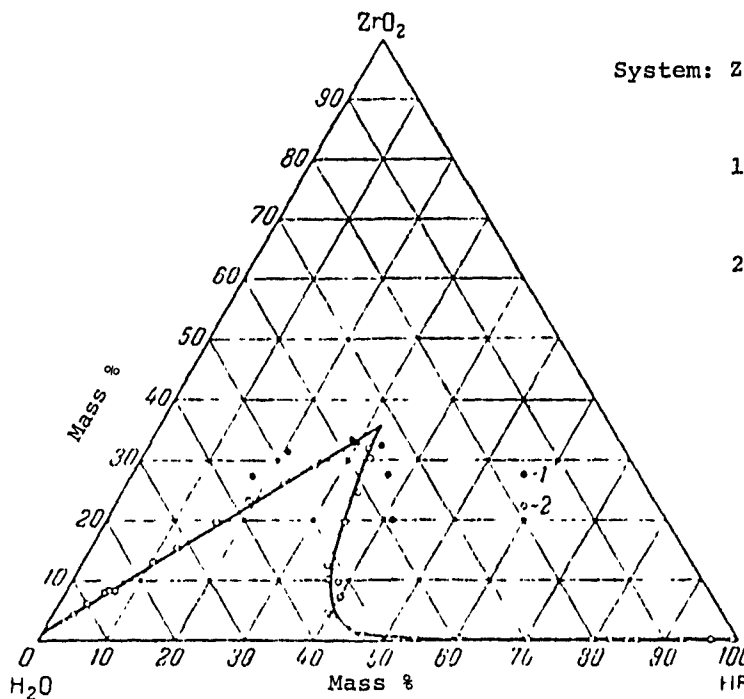

Due to the lack of agreement in the published data the evaluator cannot recommend any data. For tentative values the evaluator suggests the data of Nikolaev et al. (ref 2) for 298 K to be used (see the compilation for numerical data).

AUXILIARY INFORMATION					
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:		
Isothermal method used. Excess solid was shaken for unspecified period of time with aqueous HF. Method of analysis not specified. The composition of solid phases was not reported.			(1) The solid used for measurements was prepared by dissolving ZrO_2 in aqueous HF. The composition of the solid obtained by crystallization from 5-20 mol HF/ dm^3 was constant, and according to Chauvenet (ref 1) who obtained a compound with identical composition, was written as $ZrOF_2 \cdot H_2F_2 \cdot 2H_2O$.		
			ESTIMATED ERROR: Nothing specified.

AUXILIARY INFORMATION				
METHOD/APPARATUS/PROCEDURE:		SOURCE AND PURITY OF MATERIALS:		
Isothermal method used. The N_2O_4 -HF solutions were prepared in a vacuum line made of monel, Kel-F, and teflon parts. It contained 2 Kel-F burettes connected to reservoirs with freshly distilled solvents. From the burettes the solvents were introduced onto excess ZrF_4 in a Kel-F dissolution vessel by applying N gas pressure under cooling. The mixtures were then brought to the desired temperature and agitated with a magnetic stirrer in a thermostated glycol bath for 1000-1300 min, although equilibrium results were obtained after 360 min. After another 360-400 min standing, an aliquot of the saturated solution was withdrawn, evaporated to dryness and Zr determined gravimetrically in the residue. (The formula of Zr compound weighed not reported.) Solid phases were not investigated.		(1) ZrF_4 , purity 99.5%, source not specified. (2) N_2O_4 was prepared either by dehydration of HNO_3 with P_2O_5 and decomposition of the N_2O_5 obtained at 260° , or by thermal decomposition of $Pb(NO_3)_2$. Occasionally, a 99.5% product of Societé L'Air Liquide was also used. It was distilled over a column of P_2O_5 to obtain the anhydrous product (white when solid). (3) HF of high purity (Societé Ugine) was distilled before use to yield a product with specific conductivity of $(2-9) \times 10^{-3} \Omega^{-1}cm^{-1}$ at -15° . The conductivity was reported to increase slightly on storing in Monel containers.		
		ESTIMATED ERROR:		
		Error in composition of the solvent: $\pm 5\%$ (the accuracy with which the Kel-F burettes could be operated.) Temperature and solubility error were not reported.

VARIABLES: $T/K = 273-353$ $c_2/mol\ dm^{-3} = 1-16$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES:  <p>The figure is a phase diagram with Temperature in degrees Celsius on the y-axis (0 to 90) and Molar Concentration of Nitric Acid on the x-axis (0 to 16). Three regions are labeled: $ZrF_4 \cdot 3H_2O$ in the lower-left region, $ZrF_4 \cdot H_2O$ in the upper-middle region, and $ZrO_2 \cdot 2HF \cdot H_2O$ in the upper-right region. The boundaries between these regions are solid lines.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess $ZrF_4 \cdot H_2O$ was equilibrated with aqueous HNO_3 solutions. Equilibrium was attained very slowly at low HNO_3 concentrations and temperatures. A measured volume of the saturated solution was evaporated to dryness in a Pt dish. The residue was ignited first for several hours at 500-550°C, then at 1000°C, and ZrO_2 was weighed. Solid phases were identified by X-ray diffraction.	SOURCE AND PURITY OF MATERIALS: (1) $ZrF_4 \cdot H_2O$ was prepared by dissolution of reactor grade Zr metal in a mixture of concentrated HNO_3 and 48% HF, both analytical grade. The reaction was carried out in a teflon vessel equipped with a polyethylene reflux condenser. After complete dissolution of Zr the mixture was digested for 0.5 h, filtered, the crystals washed with acetone, and either air or oven dried.
	ESTIMATED ERROR: Temp: precision ± 1 K. Soly: precision ± 5 %

CRITICAL EVALUATION:

An evaluation of the solubility of K_2ZrF_6 in water.

Seven literature sources of the solubility of K_2ZrF_6 in H_2O are available (ref 1 - 7). Of these the results of six are compared in Figure 1. The data of Egerev and Pogorelyi (ref 5, 6) and Missenden (ref 2) present the solubilities over wide temperature ranges. At 10 °C the two data sets agree exactly, but at the higher temperatures they differ considerably, the data of Egerev and Pogorelyi (ref 5) being much higher. Egerev and Pogorelyi (ref 5) state that insufficiently pure K_2ZrF_6 was used in the older studies (ref 1, 2). This statement should be taken as only an assumption since Missenden (ref 2) reported on neither the analytical method nor the purity of the K_2ZrF_6 used. It is possible that the preparations of K_2ZrF_6 used in these studies may have been contaminated with some isomorphous hafnium salt.

At 0 °C (273.15 K) the two available experimental values (ref 1, 5) agree within 10 %. At 10 °C (283.15 K) the values from papers (ref 2, 5) agree exactly at a value of 0.043 mol kg⁻¹. The value of Marden (ref 1) for 20 °C is obviously in error. Egerev and Pogorelyi report two sets of data (ref 5, 6). The later data (ref 6) are consistently 2.5 - 4.2 % higher than the data reported only a couple of month earlier (ref 5). Only two of the values from ref 6 are shown in the figure. The single value of Schmitt *et al.* (ref 3) at 25 °C (298.15 K) (0.0812 mol dm⁻³) appears to fit the overall pattern well, but it cannot be compared directly because it is in a different unit than the other data. Tananaev and Guzeeva (ref 7) carried out a detailed study of the $ZrF_4 + KF + H_2O$ system. They report solubility values of K_2ZrF_6 under conditions that K_2ZrF_6 is the equilibrium solid that follow closely the values reported by Egerev and Pogorelyi (ref 5, 6).

Tentative values: Due to the lack of agreement in the published data, the evaluator cannot recommend any data. For tentative values, the evaluator suggests the data of Egerev and Pogorelyi (ref 5) be used (see the compilation for numerical values).

AUXILIARY INFORMATION																
METHOD/APPARATUS/PROCEDURE: Isothermal method used but no details were given. Methods of analysis and equilibrium solid phases were not reported.	SOURCE AND PURITY OF MATERIALS: (1) K_2ZrF_6 was prepared by dissolution of ZrO_2 (98% purity) in HF and neutralizing the solution with K_2CO_3 (C.P.) until a slight excess of acid remained. Pb vessels were used. After cooling, K_2ZrF_6 crystals were separated and 3x recrystallized from water. Purity of K_2ZrF_6 was estimated to be greater than 99.99%. Source and purity of water and HF not specified.

<p>VARIABLES:</p> <p>$T/K = 298$</p>	<p>PREPARED BY:</p> <p>J. Hála</p>
<p>EXPERIMENTAL VALUES:</p> <p>The solubility of K_2ZrF_6 at 25 °C is reported to be $c_1/mol\ dm^{-3} = 0.0812$. The value is the average of four measurements, but neither the individual values or standard deviation are reported.</p>	
<p>AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Isothermal method. Two saturated solutions of K_2ZrF_6 were prepared at 40 °C and another two were prepared at 20 °C. All solutions were brought to equilibrium at 25 °C with constant stirring. After attaining equilibrium, known volumes of the saturated solutions were evaporated to dryness at 70 °C, weighed, kept over P_2O_5 for several days and reweighed. All work was carried out in polyethylene ware.</p>	<p>SOURCE AND PURITY OF MATERIALS:(continued)</p> <p>The H_2ZrF_6 solution was prepared by dissolving ZrO_2 (source not specified) in excess HF. The ZrO_2 was not purified since its chief impurity, Hf, was removed by the recrystallization of the K_2ZrF_6. Spectrographic analysis of the K_2ZrF_6 showed only minor traces of impurities. The Hf content was not reported.</p> <p>(2) Deionized water was used.</p>
<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) K_2ZrF_6 was prepared by adding a concentrated solution of reagent grade KCl to a solution of H_2ZrF_6. The salt was filtered, washed, and recrystallized several times. Either Pt or polyethylene containers and deionized water were used in all steps.</p>	<p>ESTIMATED ERROR:</p> <p>Temp: accuracy ± 0.005 K. The solubility error is not specified.</p>

COMPONENTS: (1) Potassium hexafluorozirconate (IV) K_2ZrF_6 ; [16923-95-8] (2) Water; H_2O ; [7732-18-5]	ORIGINAL MEASUREMENTS: Bamburov, V.G.; Demenev, N.V.; Polyakova, V.M. <i>Izv. Sib. Otd. Akad. Nauk SSSR</i> <u>1962</u> , 5, 70-5.
VARIABLES: $T/K = 293$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: The solubility at 20°C of K_2ZrF_6 is reported as 1.48 mass % (0.0530 mol kg^{-1} a). a Calculated by compiler	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solutions containing excess K_2ZrF_6 were shaken until equilibrium was reached. K was determined gravimetrically as K_2SO_4 , F^- determined titrimetrically with $Th(NO_3)_4$ against alizarine sulfonate as indicator, or gravimetrically as CaF_2 . No method was mentioned for Zr determination.	SOURCE AND PURITY OF MATERIALS: (1) K_2ZrF_6 was prepared by equilibrating $ZrF_4 \cdot 3H_2O$ with solutions containing 0.78-1.7 mass % KF. Under these conditions K_2ZrF_6 is obtained as the equilibrium solid phase, as follows from the study of the ZrF_4 -KF- H_2O system carried out in the same document. KF, reagent grade. $ZrF_4 \cdot 3H_2O$ prepared by dissolving ZrO_2 in HF and subsequent evaporation. Source and purity of materials not specified. ESTIMATED ERROR: Temp: precision ± 0.1 K. The solubility error is not specified. REFERENCES:

COMPONENTS: (1) (OC-6-11)-Dirubidium hexafluoro-zirconate(2-); Rb_2ZrF_6 ; [16962-10-0] (2) Water; H_2O ; [7732-18-5]	ORIGINAL MEASUREMENTS: Schmitt, R. H.; Grove, E. L.; Brown, R. D. <i>J. Am. Chem. Soc.</i> <u>1960</u> , <i>82</i> , 5292-5.
VARIABLES: $T/K = 298$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p style="text-align: center;">The solubility of Rb_2ZrF_6 at 25°C is reported to be $c_1/\text{mol dm}^{-3} = 0.0848$. The value is the average of four measurements, but neither the individual values or standard deviation are reported.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method. Two saturated solutions of Rb_2ZrF_6 were prepared at 40°C and another two were prepared at 20°C . All solutions were brought to equilibrium at 25°C with constant stirring. After attaining equilibrium known volumes of the saturated solutions were evaporated to dryness at 70°C , weighed, kept over P_2O_5 for several days and reweighed. All work was carried out in polyethylene ware.	SOURCE AND PURITY OF MATERIALS: (continued) The ZrO_2 was not purified since its chief impurity, Hf, was removed by the recrystallization of the Rb_2ZrF_6 . Spectrographic analysis of the Rb_2ZrF_6 showed only minor traces of impurities. The Hf content was not reported. (2) Deionized water was used.
SOURCE AND PURITY OF MATERIALS: (1) Rb_2ZrF_6 was prepared by adding concentrated solution of RbF to a solution of H_2ZrF_6 . The salt was filtered, washed, and recrystallized several times. Either Pt or polyethylene containers and deionized water were used in all steps. The H_2ZrF_6 solution was prepared by dissolving ZrO_2 (source not specified) in excess HF.	ESTIMATED ERROR: Temp; accuracy ± 0.005 K. (NBS calibration). The solubility error is not specified. REFERENCES:

CRITICAL EVALUATION:

An evaluation of the solubility of $(\text{NH}_4)_3\text{ZrF}_7$ in water.

Two laboratories report the solubility of $(\text{NH}_4)_3\text{ZrF}_7$ in water as a function of temperature. Hevesy *et al.* (ref 1) report three values between 273 and 313 K by an isothermal method, and Kroebel *et al.* (ref 2) report a number of values between 294 and 377 K by observation of the crystallization temperature. The solubility values from the two sources are compared in the Figure. There is good agreement near 313 K, but at 293 K the Kroebel *et al.* value is much higher than the Hevesy *et al.* value.

Hevesy *et al.* (ref 1) used good control of temperature along with a precise gravimetric analysis. Kroebel *et al.* (ref 2) observed the crystallization temperatures with an uncertainty of ± 2 K. Thus the evaluator prefers the Hevesy *et al.* data as tentative values over the 273 to 313 K temperature range, and the data of Kroebel *et al.* for the higher temperatures.

<p>CRITICAL EVALUATION:</p> <p>An evaluation of the solubility of $(\text{NH}_4)_3\text{ZrF}_7$ in aqueous ammonium fluoride solutions.</p> <p>Two laboratories report the solubility of $(\text{NH}_4)_3\text{ZrF}_7$ as a function of ammonium fluoride concentration in aqueous solution. Hevesy <i>et al.</i> (ref 1) report values at 293 K for solutions up to $9.72 \text{ mol dm}^{-3} \text{ NH}_4\text{F}$. Kroebel <i>et al.</i> (ref 2) report solubility values at 294, 314, and 337 K for solutions up to $4.5 \text{ mol dm}^{-3} \text{ NH}_4\text{F}$. The solubility values at 293/294 K from the two groups are compared in the Figure. The agreement is not good, the solubility values differ by a factor of 2 in $2.0 \text{ mol dm}^{-3} \text{ NH}_4\text{F}$. The values of Kroebel <i>et al.</i> are higher than those of Hevesy <i>et al.</i> at all NH_4F concentrations and tend to level off at a constant value above $2.0 \text{ mol dm}^{-3} \text{ NH}_4\text{F}$ at this and the other temperatures.</p> <p>Hevesy <i>et al.</i> (ref 1) used good temperature control ($\pm 0.01 - 0.1 \text{ K}$) along with a precise gravimetric analysis. Kroebel <i>et al.</i> (ref 2) observed crystallization temperatures with an uncertainty of $\pm 2 \text{ K}$. The evaluator prefers the use of Hevesy <i>et al.</i> data as the tentative values at 293 K. AUXILIARY INFORMATION																					
METHOD/APPARATUS/PROCEDURE: <p>The solubility of $ZrCl_4$ in CH_3CN/isoamyl ether mixtures was obtained from the ternary $ZrCl_4/CH_3CN$/isoamyl ether phase diagram at 25°C. To prepare the 3-component mixtures, $ZrCl_4$ was sublimed <i>in vacuo</i> into a cell fitted with serum-bottle caps at sidearms; the cell was brought to atm. pressure by admission of dry air, transferred to a paraffin oil-sealed stirrer assembly, thermostated, and the solvents added through the bottle caps with hypodermic syringes. The location of points A and B on the phase diagram was determined by the interaction of the solubility line with the liquid-liquid curves. The CH_3CN-rich side of the binodal curve was constructed from clear and cloud points obtained by alternately titrating with each solvent. The points on the ether-rich side were obtained by titrating with a solution of $ZrCl_4$ in CH_3CN of a</p> <p style="text-align: right;">Continued on the next page. .</p>	SOURCE AND PURITY OF MATERIALS: (1) $ZrCl_4$ was prepared by passing Cl_2 gas over a mixture of ZrO_2 (containing 58 ppm Hf) and charcoal at 600°C, and purified by first subliming in an atmosphere of H_2 and then resubliming several times <i>in vacuo</i> . It was kept in sealed ampoules. (2) CH_3CN was dried over P_2O_5 and distilled ($n_D^{25} = 1.3418$). <p style="text-align: center;">Continued on the next page. . .</p> ESTIMATED ERROR: REFERENCES:

EXPERIMENTAL VALUES: <p>The ternary systems with $ZrCl_4$ and with $HfCl_4$ are similar. Only the complete $ZrCl_4$ system is shown. The corresponding $HfCl_4$ points are indicated by the primed letters.</p> 	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Continued from preceding page. . . homogeneous ether-rich solvent mixture until the 2-liquid phase region was reached. The points on the line representing equilibrium between the solid phase and the mixed solvent were determined by adding various solvent mixtures to $ZrCl_4$, until the solid phase disappeared. The composition of the equilibrium solid phase was obtained by the method of wet residues. Zr in liquid or solid samples was determined by adding the samples to an excess of water, distilling off the solvent with steam, and precipitating hydrated Zr oxide with NH_3 solution. To determine N in the solid phases, samples were dissolved in glacial acetic acid and N determined by the Kjeldahl method. The ether was obtained by difference.	SOURCE AND PURITY OF MATERIALS: Continued from preceding page. . . (3) Isoamyl ether was purified from peroxides, dried with $CaCl_2$ and Na ribbon, and distilled ($n_D^{25} = 1.4059$). Atmospheric moisture was excluded during distillation of the solvents.

Calculated by compiler</p> <p>Up to 72° the solid phase is zirconium dichloride oxide octahydrate, $ZrOCl_2 \cdot 8H_2O$ [13520-92-8]. Above 72°, due to partial hydrolysis of $Zr(IV)$, the solid phase contained less Cl^- than would correspond to $ZrOCl_2 \cdot 8H_2O$. The decrease in solubility above 72° was accordingly explained by lower solubility of the hydrolyzed species.</p>		$ZrOCl_2$			$ZrOCl_2$			$t/^\circ C$	mass%	$m_1/mol\ kg^{-1a}$	$t/^\circ C$	mass%	$m_1/mol\ kg^{-1a}$	-2	34.11	2.90	60	45.34	4.66	0	34.30	2.94	65	51.17	5.88	5	34.71	2.99	70	60.02	8.43	10	35.26	3.06	70.5	60.74	8.69	15	36.15	3.21	72	57.72	7.66	20	36.69	3.25	75	53.24	6.39	25	37.07	3.30	80	49.90	5.59	30	37.65	3.38	85	48.32	5.24	35	38.55	3.52	90	47.64	5.10	40	38.69	3.54	95	47.15	5.01	45	38.98	3.59	100	46.66	4.91	50	39.95	3.73	105	46.58	4.89	55	41.83	4.04

AUXILIARY INFORMATION																																																																																											
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solutions containing excess solid were mixed for 24 h (2 h were necessary to reach equilibrium). Up to 50° , samples for analysis were taken by means of a pipette with a thermostated jacket. Above 50° samples were sucked into a weighed glass tube. Zr was determined gravimetrically as ZrO_2 , Cl^- gravimetrically as $AgCl$.	SOURCE AND PURITY OF MATERIALS: (1) Specpure $ZrOCl_2 \cdot 8H_2O$ was purified by ion-exchange chromatography to reduce Hf content to $< 0.01\%$, and then 5-times recrystallized from $6\ mol\ dm^{-3}\ HCl$. (2) Source and purity of water not specified. ESTIMATED ERROR: Temp: precision $\pm 0.05\ K$. Soly: precision $\pm 1-2\ \%$ (compiler). REFERENCES:																																																																																										

<p>COMPONENTS:</p> <p>(1) Zirconium chloride oxide or dichlorooxozirconium; $ZrOCl_2$; [7699-43-6]</p> <p>(2) Hydrogen chloride; HCl; [7647-01-0]</p> <p>(3) Water; H_2O; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61 137 Brno, Czechoslovakia</p> <p>June 1985</p>
<p>CRITICAL EVALUATION:</p> <p>An evaluation of the solubility of $ZrOCl_2$ in aqueous hydrogen chloride solutions.</p> <p>Although four literature sources (ref 1-4) on the $ZrOCl_2 + HCl + H_2O$ system are available their data are not strictly comparable. The work of Hevesy (ref 1) gives the solubility in mol dm^{-3} at 20°C whereas the other three sources give the solubility in mol kg^{-1}. Of the later three, the data of Schmid (ref 2) cannot be used for comparison because the equilibrium concentration of HCl was not given. Schmid's results are based on a solution that was initially 37% HCl. He used the solid $ZrOCl_2 \cdot 8H_2O$ and, as he mentions himself, he did not take into account the dilution of the system by the dissolved water of crystallization.</p> <p>In comparing the data published by Goroshchenko and Spasibenko (ref 3) for $0, 30, 50$ and 70°C and by Kamaeva <i>et al.</i> (ref 4) at 25°C the regions for low and high HCl concentration should be considered separately. The data of Kamaeva <i>et al.</i> (ref 4) for 25°C are compared with the 30°C data of Goroshchenko and Spasibenko (ref 3) in Figure 1. At low HCl concentrations the two data sets differ considerably. The most obvious reason for the difference is that Goroshchenko and Spasibenko started with solid hydrated ZrO_2 rather than $ZrOCl_2$. A comparison of the data at high acidities is not possible because of the difference in temperature used by the two laboratories. Another discrepancy is that although Goroshchenko and Spasibenko clearly show that the solubility increases with temperature, the data of Kamaeva <i>et al.</i> at 25°C are higher than the Goroshchenko <i>et al.</i> data at 30°C. A possible reason for the difference may be in the method of determination of the equilibrium HCl concentration. Kamaeva <i>et al.</i> used titration with alkali in hot solutions while the other workers (ref 3) did not mention the analytical method used.</p> <p>The features in which the papers (ref 1, 3, 4) agree is the increase of $ZrOCl_2$ solubility in the high acidity range. This is caused by anionic chloro-complexes of Zr(IV).</p> <p><i>Tentative values:</i> Due to the lack of agreement among the published data, the evaluator cannot recommend any data. For tentative values, the evaluator suggests the 298 K data of Kamaeva <i>et al.</i> (ref 4) and the 293 K data of Hevesy (ref 1) be used for the mol kg^{-1} and mol dm^{-3} scales, respectively (see the compilations for the numerical values).</p> <p>REFERENCES:</p> <ol style="list-style-type: none"> 1. von Hevesy, G. <i>Kgl. EXPERIMENTAL VALUES: <div style="text-align: center;"> </div> <p style="text-align: center;"> A and a: $\text{ZrO}_2 \cdot x\text{H}_2\text{O}$ B and b: $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$ C and c: $\text{ZrOCl}_2 \cdot 3\text{H}_2\text{O}$ </p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solutions containing excess solid, either Zr hydroxide or ZrOCl_2 , were mixed for 3 hours-8 days. Equilibrium was slow in the regions of hydrolysis and $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$ crystallization. In the range of high HCl concentrations the systems were prepared by saturating aqueous solutions of ZrOCl_2 with gaseous HCl. Analytical methods not given. Solid phases were identified by microscopy, chemical analysis, and Schreinemakers' method.	SOURCE AND PURITY OF MATERIALS: (1) $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$ prepared from tech. grade ZrO_2 and purified from Hf by ferrocyanide method and by cyclohexanone extraction. After recrystallization from aqueous HCl its Hf content was less than 0.02%. Zr hydroxide was prepared by passing a ZrOCl_2 solution through an anion exchange resin in OH^- form to remove free HCl. Neutral ZrOCl_2 solution was then mixed with anion exchange resin, and Zr hydroxide was obtained by hydrolysis. It was washed with water and dried at 100° . The product contained 44.46% ZrO_2 , 3.67% HCl and 51.87% H_2O . (2) Source and purity of HCl not specified. (3) Distilled water.
ESTIMATED ERROR Temp: precision ± 0.1 K. The solubility error cannot be estimated since the methods of analysis were not given.

60.30	27.61	16.85	4.140
51.50	18.68	19.65	3.824

a. Calculated by compilers

**AUXILIARY INFORMATION****METHOD/APPARATUS/PROCEDURE:**

Equilibrium solid phases were studied by X-ray diffraction, thermal analysis, crystal-optical analysis, and infrared spectroscopy. No other details were given, but the isothermal method was probably used as in earlier work (ref 1).

SOURCE AND PURITY OF MATERIALS:

Nothing specified.

ESTIMATED ERROR:

Temp: precision 0.1 K (ref 1).
 Soly: precision 1-2 % (compiler, ref 1).

c. Eutonic point					
AUXILIARY INFORMATION					
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:		
Experimental details stated to be similar to those reported in earlier work (refs 1,2). Isothermal method was used. Solutions with excess solid were stirred for 8-10 h at 25°C. Total Cl content determined by Volhard's method, Zr determined by chelatometric titration in 5 mol dm^{-3} HCl. Method for analysis of Mg not given. Solid phases were analysed using the Schreinemakers' method of wet residues.			(1) $ZrOCl_2 \cdot 8H_2O$ was recrystallized from 6 mol dm^{-3} HCl (refs 1,2). (2) Reagent grade $MgCl_2 \cdot 6H_2O$ was recrystallized from water. (3) Sources and purities of water and HCl were not specified.		
In the source paper, the authors also report the viscosities (η) and electrical conductivities (κ) for each of the saturated solutions.			ESTIMATED ERROR: Temp: precision ± 0.1 K (compiler, refs 1, 2). Soly: precision $\pm 2-5$ % (compiler).

AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. After equilibration the systems were filtered in a thermostated apparatus. Zr and Ca were determined titrimetrically with EDTA using Eriochrome T as indicator. Free HCl was titrated in a heated aliquot against Methyl Orange. Solid phases were identified by Schreinemakers' method, by the method of indifferent additions using $FeCl_3$, and by microscopic analysis.	SOURCE AND PURITY OF MATERIALS: (1) $ZrOCl_2 \cdot 8H_2O$, reagent grade, containing 0.5-1% Hf , 3-times recrystallized; (2) $CaCl_2 \cdot 6H_2O$, reagent grade, twice recrystallized. (3) HCl prepared from reagent grade $NaCl$ and H_2SO_4 .
	ESTIMATED ERROR: Temp: precision ± 0.1 K. Soly: precision $\pm 2-5$ % (compiler).

AUXILIARY INFORMATION																																																																															
METHOD/APPARATUS/PROCEDURE: Experimental details stated to be similar to those reported in earlier work (refs 1,2). Isothermal method was used. Solutions with excess solid were stirred for 8-10 h at 25°C. Total Cl content determined by Volhard's method, Zr determined by chelatometric titration in 5 mol dm^{-3} HCl. Method for analysis of Sr not given. Solid phases were analyzed using the Schreinemakers' method of wet residues. In the source paper, the authors also report the viscosities (η) and electrical conductivities (κ) for each of the saturated solutions.	SOURCE AND PURITY OF MATERIALS: (1) $ZrOCl_2 \cdot 8H_2O$, reagent grade, recrystallized from 6 mol dm^{-3} HCl. (2) $SrCl_2 \cdot 6H_2O$, reagent grade, recrystallized from water. (3) Source and purity of water and HCl not specified. ESTIMATED ERROR: Temp: precision ± 0.1 K (compiler, refs 1, 2). Soly: precision $\pm 2-5$ % (compiler). REFERENCES: 1. ^a Total acidity defined as the total concentration of HCl and HNO ₃ used to dissolve ZrO ₂ and make up the solution. It includes both combined and free acids. Equilibrium total acidity found to be constant within 8.0 ± 0.2 mol dm ⁻³ .							
^b Initial concentration.							
^c Equilibrium concentration.							
^d At 25°C.							
NOTE: For all saturated solution the equilibrium solid phases were found to be solid solutions formed by inclusion of ZrO(NO ₃) ₂ ·5H ₂ O into the lattice of ZrOCl ₂ ·8H ₂ O.

VARIABLES: $T/K = 273$ $c(NO_3^-)/c(Cl^-)$ ratio	PREPARED BY: J. Hála
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Aliquots of the stock solution of Zr(IV) in a mixture of HCl and HNO_3 were mixed with 10 mol dm^{-3} solutions of acids to obtain solutions with the desired total acidity at 25° . These solutions were equilibrated at 0° in conical stoppered flasks for 100-350 days since long waiting times were needed for crystallization to take place. Crystallization times were inversely proportional to the Cl^-/NO_3^- ratios, and seeding with $ZrOCl_2 \cdot 8H_2O$ or $Zr(NO_3)_2 \cdot 5H_2O$ crystals was not effective in accelerating crystallization. When the amount of crystals seemed to remain unchanged they were filtered and washed with diethylether cooled to $0^\circ C$. Solid phases and saturated solutions were analyzed for Cl^- , NO_3^- , and Zr. Cl^- was titrated by Volhard method, NO_3^- determined alkalimetrically after reduction to NH_3 by Dewarda alloy, and Zr determined gravimetrically as ZrO_2 . For each solution mass% were also calculated from molarity and density data. Calculated values were reported to be in good agreement with analytical results. Total acidity was obtained from Cl^- and NO_3^- concentrations. Solid phases were also characterized by x-ray diffraction.	
AUXILIARY INFORMATION	
SOURCE AND PURITY OF MATERIALS: All chemicals used were reagent grade (their source was not specified). Solutions containing high Zr concentrations were prepared from partially dehydrated hydrous Zr oxide. The latter was prepared by precipitating Zr hydroxide with NH_4OH , washing it with water, and dehydrating the paste (containing 80% H_2O) by heterogeneous distillation with toluene. The product contained 19% H_2O and was dissolved by gentle heating in a mixture of concentrated HNO_3 and HCl to obtain a stock solution containing (in mol dm^{-3}) 3.01 ZrO_2^{2+} , 5.70 NO_3^- , and 2.30 Cl^- .	SOURCE AND PURITY OF MATERIALS: ESTIMATED ERROR: Temperature error is not specified. Soly: precision in Zr analysis ± 0.1 %, Cl^- and NO_3^- ± 0.2 %. REFERENCES:

COMPONENTS: (1) Hafnium fluoride; HfF_4 ; [13709-52-9] (2) Hydrogen fluoride; HF; [7664-39-3] (3) Water; H_2O ; [7732-18-5]	EVALUATOR: J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61137 Brno, Czechoslovakia June 1985
CRITICAL EVALUATION: The solubility of hafnium fluoride in aqueous hydrogen fluoride. The solubility of HfF_4 was determined at 298 K as a function of HF concentration by Hevesy and Wagner (ref 1) and Buslaev and Nikolaev (ref 2). An inspection of the molal ($m_1/\text{mol kg}^{-1}$) solubility data in the compilations shows that at low HF concentrations the two data sets differ greatly. The reason for the discrepancy is not clear. The two values of Hevesy and Wagner (ref 1) agree well with the isotherms of Buslaev and Nikolaev (ref 2) at the highest HF concentrations. Due to the lack of agreement in the published values in the low HF concentration range the evaluator cannot recommend any data. For tentative values the evaluator suggests the data of Buslaev and Nikolaev (ref 2) for 298 K to be used (see the compilation for the numerical data). REFERENCES: 1. von Hevesy, G.; Wagner, O. EXPERIMENTAL VALUES:  <p style="text-align: center;">The system HF - HfF_4 - H_2O (25°C isotherm).</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess HfF_4 was shaken with aqueous HF for 3 h. in bottles made of fluoroplast-4. Samples of solutions were taken by means of a Pt pipette. F^- in solutions containing Hf was determined alkalimetrically against phenolphthalein whereby free HF and 3/4 of F bound to Hf were titrated. HF was determined potentiometrically (ref 1); for mole ratio HF/ $\text{HfO}_2 < 4$ a known amount of HCl + KF was added before titration. K_2HfF_6 was formed and excess acid was back-titrated with alkali. Hf was determined gravimetrically after removal of HF by evaporation with H_2SO_4 . Solid phases were identified by chemical analysis.	SOURCE AND PURITY OF MATERIALS: (1) HfF_4 was prepared by dissolving HfO_2 (98.7%) in HF. The solution was evaporated and the residue used for solubility measurements. Source and purity of HF and water not specified.

^b Calculated by compiler.

^c Value given in the text of the original document.

AUXILIARY INFORMATION**METHOD/APPARATUS/PROCEDURE:**

Isothermal method used. Equilibration time and details of the method not specified. Saturated solutions were analyzed for HfF_4 gravimetrically by an unspecified method and for CH_3COOH by alkalimetric titration. The composition of the solid phases was found by Schreinemakers method and by chemical and x-ray diffraction analysis.

ESTIMATED ERROR:

Nothing specified.

SOURCE AND PURITY OF MATERIALS:

- (1) HfF_4 was prepared by thermal decomposition of $(\text{NH}_4)_2\text{HfF}_6$ (ref 1). Source and purity of the ammonium salt used not specified.
- (2) Anhydrous KF prepared by prolonged drying of $\text{KF} \cdot 2\text{H}_2\text{O}$ over P_2O_5 in vacuum. Source and purity not specified.
- (3) Acetic acid (source and purity not specified) was dried by distillation over P_2O_5 .

(1) (OC-6-11)-Dipotassium hexafluoro- hafnate(2-); K_2HfF_6 ; [16871-86-6] (2) Water; H_2O ; [7732-18-5]	J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61 137 Brno, Czechoslovakia June 1985														
<p>CRITICAL EVALUATION:</p> <p>The solubility of potassium hexafluorohafnate in water.</p> <p>Egerev and Pogorelyi (ref 1) report the solubility of K_2HfF_6 in water at ten degree intervals between 273.16 and 373.16 K. They fitted their data by the method of least squares to the equation $\log S = -(1637.5)/(T/K) + 3.6512$, where S is mol/100 g H_2O. The regression line fits the experimental values at 273 and 373 poorly, but appears to be satisfactory at the other temperatures.</p> <p>Single solubility values are reported at 298.15 K by Tananaev and Guzeeva (ref 2), $0.1244 \text{ mol dm}^{-3}$, and Schmitt <i>et al.</i> (ref 3), $0.128 \text{ mol dm}^{-3}$. The average of $(0.126 \pm 0.002) \text{ mol dm}^{-3}$ is recommended. The recommended value and several values from the equation of Egerev and Pogorelyi are given below.</p> <p>Table 1. EXPERIMENTAL VALUES: <p style="text-align: center;">The solubility of K_2HfF_6 at $25^\circ C$ is reported to be $c_1/mol\ dm^{-3} = 0.128$. The value is the average of four measurements, but neither the individual values or standard deviation are reported.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method. Two saturated solutions of K_2HfF_6 were prepared at $40^\circ C$ and another two were prepared at $20^\circ C$. All solutions were brought to equilibrium at $25^\circ C$ with constant stirring. After attaining equilibrium, known volumes of the saturated solutions were evaporated to dryness at $70^\circ C$, weighed, kept over P_2O_5 for several days and reweighed. All work was carried out in polyethylene ware.	SOURCE AND PURITY OF MATERIALS: The H_2HfF_6 solution was prepared by dissolving HfO_2 (source not specified) in excess HF. The HfO_2 was not purified since its chief impurity, Zr, was removed by the recrystallization of the H_2HfF_6 . Spectrographic analysis of the H_2HfF_6 showed only minor traces of impurities. The content was not reported. (2) Deionized water was used.
SOURCE AND PURITY OF MATERIALS: (1) K_2HfF_6 was prepared by adding a concentrated solution of reagent grade KCl to a solution of H_2HfF_6 . The salt was filtered, washed, and recrystallized several times. Either Pt or polyethylene containers and deionized water were used in all steps.	ESTIMATED ERROR: Temp: accuracy $\pm 0.005\ K$, (NBS calibration). The solubility error is not specified.

METHOD/APPARATUS/PROCEDURE: Isothermal method used. Each measurement was repeated 2-6 times. Samples of saturated solutions were taken by means of a pipette heated to the corresponding temperature. The samples were weighed and evaporated, the residue dried at 105°C and weighed. The authors do not report on the equilibrium solid phases.	SOURCE AND PURITY OF MATERIALS: (1) K_2HfF_6 was prepared from Hf metal obtained by thermal decomposition of HfI_4 . Hf contained less than 1% Zr and $10^{-2}\%$ Si, Fe, Al, and Ti. Source and purity of other chemicals not specified. ESTIMATED ERROR: Temp: precision ± 0.1 K. The error of the arithmetic mean solubility varied from 0.04 to 1.1% depending on the number of measurements. REFERENCES:

AUXILIARY INFORMATION																											
METHOD/APPARATUS/PROCEDURE: <p>The solubility of HfCl_4 in $\text{CH}_3\text{CN}/\text{isoamyl ether}$ mixtures was obtained from the ternary $\text{HfCl}_4/\text{CH}_3\text{CN}/\text{isoamyl ether}$ phase diagram at 25°C. To prepare the 3-component mixtures, HfCl_4 was sublimed <i>in vacuo</i> into a cell fitted with serum-bottle caps at sidearms; the cell was brought to atm. pressure by admission of dry air, transferred to a paraffin oil-sealed stirrer assembly, thermostated, and the solvents added through the bottle caps with hypodermic syringes. The location of points A' and B' on the phase diagram was determined by the interaction of the solubility line with the liquid-liquid curves. The CH_3CN-rich side of the binodal curve was constructed from clear and cloud points obtained by alternately titrating with each solvent. The points on the ether-rich side were obtained by titrating with a solution of HfCl_4 in CH_3CN of Continued on the next page. . .</p>	SOURCE AND PURITY OF MATERIALS: (1) HfCl_4 was prepared by passing Cl_2 gas over a mixt. of HfO_2 (containing 1 or 2% ZrO_2) and charcoal at 600°C , and purified by first subliming in an atmosphere of H_2 and then resubliming several times <i>in vacuo</i> . It was kept in sealed ampoules. The atomic mass of Hf was corrected for the Zr content. (2) CH_3CN was dried over P_2O_5 and Continued on the next page. . . ESTIMATED ERROR: Temp: precision ± 0.01 K. AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Continued from preceding page. . . <p>a homogeneous ether-rich solvent mixture until the 2-liquid phase region was reached. The points on the line representing equilibrium between the solid phase and the mixed solvent were determined by adding various solvent mixtures to HfCl_4 until the solid phase disappeared. The composition of the equilibrium solid phase was obtained by the method of wet residues. Hf in liquid or solid samples was determined by adding the samples to an excess of water, distilling off the solvent with steam, and precipitating hydrated Hf oxide with NH_3 solution. To determine N in the solid phases, samples were dissolved in glacial acetic acid and N determined by the Kjeldahl method. The ether was obtained by difference.</p>	SOURCE AND PURITY OF MATERIALS: Continued from preceding page. . . distilled ($n_D^{25} = 1.3418$). 3) Isoamyl ether was purified from peroxides, dried with CaCl_2 and Na ribbon, and distilled ($N_D^{25} = 1.4059$). Atmospheric moisture was excluded during distillation of the solvents.
ESTIMATED ERROR: See previous page.

Calculated by compiler:

^a from mass% HfO_2 ^b from mass% Cl^c from the average of the calculated mass% HfOCl_2 ^d The solubility value reported as being average of several measurements but the individual data were not given.

NOTE: In the temperature range of 0-80°C the Hf:Cl ratio in saturated solutions and solid phases varied within 1:1.98 - 1:2.04 and 1:1.89 - 1:1.97, respectively. The smooth inflection at 90-100°C on the solubility versus temperature plot was ascribed by the authors to increasing hydrolysis and polymerization with the formation of a new compound whose solubility also increases with increasing temperature. Increasing hydrolysis of HfOCl_2 at high temperatures was indicated by appreciable loss of HCl through the seal of the vessels. Although not stated explicitly the data suggest that the solid phase at <80°C was apparently the hydrate $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$.

COMPONENTS: (1) Hafnium dichloride oxide; HfOCl_2 : [13759-17-6] (2) Water; H_2O ; [7732-18-5]	ORIGINAL MEASUREMENTS: Blinova, Z. N.; Komissarova, L. N. <i>Zh. Neorg. Khim.</i> <u>1972</u> , <i>17</i> , 2520-5. <i>Russ. J. Inorg. Chem. (Engl. Transl.)</i> <u>1972</u> , <i>17</i> , 1318-21.
VARIABLES: $T/K = 273 - 393$	PREPARED BY: J. Hála
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was equilibrated with water at the desired temperature for 1-2 h in glass vessels with liquid paraffine hydraulic seal. The vessels were thermostated in water ($15-60^\circ$), in glycerine above 60° , or in ice at 0° . Samples of the saturated solutions and solid phases were analyzed for Hf and Cl gravimetrically as HfO_2 and AgCl , respectively. At higher temperatures samples of saturated solutions were withdrawn with a heated pipette. Samples of solid phases were taken only from measurements at $<80^\circ$ since at higher temperatures the mother liquor crystallized rapidly. The solid phases were also characterized by a polarizing microscope.	SOURCE AND PURITY OF MATERIALS: (1) $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was prepared from HfO_2 (99.33 mass% Hf, 0.55 mass% Zr). HfO_2 was heated with a mixture of $(\text{NH}_4)_2\text{SO}_4$ and concentrated H_2SO_4 to $300-450^\circ$, the melt was dissolved in distilled water, and Hf was precipitated with concentrated NH_4OH . Hf hydroxide was washed free from sulfate by decantation, dissolved in concentrated HCl , and $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ obtained by crystallization. HCl used was reagent grade.
	ESTIMATED ERROR: Temp: precision ± 0.1 K. The solubility error is not specified.

<p>COMPONENTS:</p> <p>(1) Hafnium oxide chloride; HfOCl_2; [13759-17-6]</p> <p>(2) Hydrogen chloride; HCl; [7647-01-0]</p> <p>(3) Water; H_2O; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61 137 Brno, Czechoslovakia</p> <p>February 1985</p>
<p>CRITICAL EVALUATION:</p> <p>An evaluation of the solubility of HfOCl_2 in aqueous hydrogen chloride solutions.</p> <p>There are four literature sources on the $\text{HfOCl}_2 + \text{HCl} + \text{H}_2\text{O}$ system available (ref 1 - 4). The work of Hevesy (ref 1) gives the solubility in mol dm^{-3} at 293 K whereas in the other documents the solubility was presented in mass % of either HfOCl_2 (ref 3), or HfO_2 (ref 2, 4) from which the solubilities were calculated in mol kg^{-1}.</p> <p>There are great differences in the solubilities at low acidities between the data of Goroshchenko and Spasibenko (ref 2) and the data in the other papers (ref 3, 4). In (ref 3, 4) the HfOCl_2 solubility decreases as the HCl solubility increases while the solubilities reported by Goroshchenko and Spasibenko increase with HCl concentration. The reason is that they started with hydrated HfO_2 as the solid. Thus, the low acidity region of paper (ref 2) has been disregarded.</p> <p>There are two general features of the solubility of HfOCl_2 in HCl solutions. They are (i) an increase in the solubility with increasing temperature, and (ii) the appearance of a shallow minimum (at 25-30 mass % HCl in solution) on the solubility <i>vs.</i> m_{HCl} plot (ref 1-4). The increase in the solubility of HfOCl_2 at acidities > 30 mass% HCl is caused by the formation of anionic chlorocomplexes of Hf(IV) in solution.</p> <p>The data sets of Kamaneva <i>et al.</i> (ref 3) and Blinova and Komissarova (ref 4) are compared for 298 K and the data sets of Goroshchenko and Spasibenko (ref 2) and Blinova and Komissarova (ref 4) are compared for 273 K (see Figures 1 and 2). For both temperatures a reasonable agreement of data is observed at acidities > 18 mass % HCl, although there is some discrepancy for the solubility increase above 30 mass % at 273 K.</p> <p>Both sets of data were smoothed by a linear regression of the data to a fifth order polynomial in HCl mass %. At 298 K (Figure 1) the equation for the HCl mass % range of 18 to 39 is [Eqn (1)]</p> $(m_1/\text{mol kg}^{-1}) = 11.9049 - 1.5070(100w_2) + 6.5960 \times 10^{-2}(100w_2)^2 - 9.0494 \times 10^{-4}(100w_2)^3 - 9.4593 \times 10^{-6}(100w_2)^4 + 2.5099 \times 10^{-7}(100w_2)^5$ <p>At 273 K there is a disagreement in the data above 32 mass % HCl (Figure 2). The data of Blinova and Komissarova (ref 4) show the generally accepted increase in solubility of HfOCl_2 with increasing HCl mass %. The data of Goroshchenko and Spasibenko (ref 2) do not show the expected increase. The evaluator believes the data of Blinova and Komissarova should be given preference in the high HCl region. The smoothing equation below was prepared by a linear regression which did not include the three experimental points of Goroshchenko and Spasibenko above 31.5 mass % HCl.</p> $(m_1/\text{mol kg}^{-1}) = 5.7634 - 0.63134(100w_2) + 2.0545 \times 10^{-2}(100w_2)^2 + 7.5962 \times 10^{-5}(100w_2)^3 - 1.5377 \times 10^{-5}(100w_2)^4 + 2.1147 \times 10^{-7}(100w_2)^5$ <p>The solid line of Figure 2 was calculated from the above equation [Eqn(2)]. The equation below [Eqn (3)] was obtained from a linear regression which included the Goroshchenko and Spasibenko data above 31.5 mass % HCl. The equation is:</p> $(m_1/\text{mol kg}^{-1}) = 6.2671 - 0.68204(100w_2) + 2.1591 \times 10^{-2}(100w_2)^2 + 1.0237 \times 10^{-4}(100w_2)^3 - 1.6081 \times 10^{-5}(100w_2)^4 + 2.0871 \times 10^{-7}(100w_2)^5$ <p>See the dashed line in Figure 2, which show a deviation from [Eqn (2)] at high HCl concentrations.</p>	

COMPONENTS: (1) Hafnium oxide chloride; HfOCl_2 ; [13759-17-6] (2) Hydrogen chloride; HCl ; [7647-01-0] (3) Water; H_2O ; [7732-18-5]	EVALUATOR: J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61 137 Brno, Czechoslovakia February 1985
CRITICAL EVALUATION: An evaluation of the solubility of HfOCl_2 in aqueous hydrogen chloride solutions (continued). Additional discrepancies can be noted for the higher temperature data. The values of Kamaeva <i>et al.</i> (ref 3) at 298 K are higher than the Goroshchenko and Spasibenko values at 303 K in the high acidity region, although it is known that the solubility increases with temperature. The data of Blinova and Komissarova (ref 4) for 12 to 14.15 mass % HCl appear to be unreasonably high, and correspond to values for low acidities in other documents (ref 2, 3). The reason for this is not clear, although supersaturated solutions are a possibility. The evaluator suggests these data be classed as doubtful. The molalities of HCl calculated from the mass % HCl data of (ref 4) pass through a minimum in spite of the increasing HCl concentration (the water concentration increases in the system along with that of HCl). A similar, but less pronounced effect, is observed for the HCl molalities calculated from the data of (ref 2). Therefore the mass % HCl rather than the mol kg^{-1} scale has been chosen for the graphical comparisons of data in Figures 1 and 2. <i>Tentative values:</i> The evaluator suggests the following be used as tentative values. At 273 K use values calculated from [Eqn (2)]. At 298 K use values calculated from [Eqn (1)]. At 303 and 323 K use the data of Goroshchenko and Spasibenko (ref 2). AUXILIARY INFORMATION				
METHOD/APPARATUS/PROCEDURE:		SOURCE AND PURITY OF MATERIALS:		
Isothermal method used. Solutions containing excess of either Hf hydroxide or $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ were mixed for unspecified long period of time. Where Hf hydroxide was used, it was prepared by passing HfOCl_2 solution through a column of EDE-10P anion exchanger in OH form. The product contained 88.41% HfO_2 , 0.46% HCl and 11.13% H_2O . Analytical methods not specified. The composition of solid phases was determined by chemical analysis and X-ray diffraction. Hf hydroxide which was in equilibrium with solutions of low acidity (<13 wt % HCl) was analyzed after drying. The composition of $\text{HfOCl}_2 \cdot 3\text{H}_2\text{O}$ was also confirmed by Schreinemakers' method and by the method of indifferent addition.		(1) $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was prepared from HfO_2 containing 0.55% ZrO_2 , 0.1% TiO_2 , 0.003% Fe_2O_3 and 0.02% Al_2O_3 . The product was twice recrystallized from aqueous HCl .		
		(2,3) Source and purity of HCl and water not specified.		
		ESTIMATED ERROR:		
		Temp: precision ± 0.1 K. The solubility error is not specified.

AUXILIARY INFORMATION																																																																																																										
METHOD/APPARATUS/PROCEDURE: Isothermal method used as described previously (ref 1). Solutions containing excess solid were mechanically mixed, and equilibrium was assumed to be reached in 8 days by analogy to previous results (ref 1). Hf was determined titrimetrically with EDTA against Xylenol Orange, HCl was titrated with alkali. Solid phases were identified by Schreinemakers' method and by microscopy.	SOURCE AND PURITY OF MATERIALS: (1) $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ prepared by hydrolysis of HfCl_4 . The product was twice recrystallized from aqueous HCl. Source and purity of HfCl_4 not specified. (2) HCl prepared from CP grade NaCl and H_2SO_4 . (3) Distilled water was used.																																																																																																									
ESTIMATED ERROR: Temp: precision ± 0.05 K. Soly: precision $\pm 2-5$ % (compiler).

EXPERIMENTAL VALUES:

Figure 25 Solubility isotherm for hafnium oxide chloride in HCl solutions at 0°C (a) and 25°C (b).

AUXILIARY INFORMATION**METHOD/APPARATUS/PROCEDURE:**

Isothermal method used. Excess $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was equilibrated in a thermostated bath with HCl solutions of the desired concentration in glass vessels with liquid paraffine hydraulic seal. Solutions of HCl with $d. > 1.19 \text{ g cm}^{-3}$ were prepared by saturating concentrated HCl solution with HCl gas. Equilibrium was established within 5-6 days at 0° , and in 2 days at 25° . Samples of the saturated solutions and solid phases were analyzed gravimetrically for Hf and Cl as HfO_2 and AgCl , respectively. Solid phases were also characterized by optical microscopy and the method of wet residues.

SOURCE AND PURITY OF MATERIALS:

- (1) $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was prepared from HfO_2 (99.33 mass % Hf , 0.55 mass % Zr). HfO_2 was heated with a mixture of $(\text{NH}_4)_2\text{SO}_4$ and concentrated H_2SO_4 to 300-450, the melt was dissolved in distilled water, and Hf was precipitated with concentrated NH_4OH . Hf hydroxide was washed free from sulfate by decantation, dissolved in concentrated HCl , and $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ obtained by crystallization.
- (2) Reagent grade HCl was used.

ESTIMATED ERROR:

Temp: precision $\pm 0.1 \text{ K}$.
 The solubility error is not specified.

c. Data from the 1971 document			AUXILIARY INFORMATION			
METHOD/APPARATUS/PROCEDURE:			SOURCE AND PURITY OF MATERIALS:			
Isothermal method used. Solutions containing excess solid were shaken for 8 h. Samples for analysis were taken by means of a pipette heated previously to 25 or 50°C, and filtered through thermostated Schott crucibles. Hf and Ca were determined titrimetrically with EDTA against Xylenol Orange and Murexide respectively as indicators. Solid phases were identified by chemical and microscopic analysis and by Schreinemakers' method.			(1)HfOCl ₂ ·8H ₂ O was prepared from HfO ₂ of unspecified purity. The oxide was melted with borax and Na ₂ CO ₃ , the melt dissolved in HCl, and the product recrystallized three times.			
			(2)CaCl ₂ ·2H ₂ O (pure) was recrystallized from water.

METHOD/APPARATUS/PROCEDURE: Isothermal method (ref 1) used. Solutions containing excess solid were shaken for 8-12 h. Hf was determined gravimetrically as HfO_2 , total Cl^- content by Volhard's method. CsCl concentration found by difference. Equilibrium solid phases were studied by X-ray diffraction, thermal analysis, microscopy, and IR spectroscopy.	SOURCE AND PURITY OF MATERIALS: (1) As in the authors' previous work (ref 1), $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was prepared by crystallization from solutions of HfCl_4 in HCl . (2) CsCl , reagent grade, source and purity of other chemicals not specified.																
	ESTIMATED ERROR: Temp: precision ± 0.1 K. Soly: precision $\pm 1-2$ % (compiler).																
	REFERENCES: 1. Barskaya, I.B.; Morozov, I.S. <i>Zh. Neorg. Khim.</i> <u>1968</u> , <i>13</i> , 1408; <i>Russ. J. Inorg. Chem. (Engl. Transl.)</i> <u>1968</u> , <i>13</i> , 738.																

COMPONENTS: (1) Hafnium dichloride oxide octahydrate; $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$; [14456-34-9] (2) Methanol; CH_4O ; [67-56-1]	ORIGINAL MEASUREMENTS: Blinova, Z. N.; Komissarova, L. N. <i>Zh. Neorg. Khim.</i> <u>1972</u> , <i>17</i> , 2520-5. <i>Russ. J. Inorg. Chem. (Engl. Transl.)</i> <u>1972</u> , <i>17</i> , 1318-21.
VARIABLES: $T/K = 298$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p>The solubility of $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ is reported to be 30.12 mass % HfO_2 or 58.54 mass % HfOCl_2. The equilibrium solid phase was $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$.</p> <p><i>NOTE:</i> The latter value apparently represents the solubility of the hydrated salt. From the mass % HfO_2 the compiler calculated the solubility of the equilibrium solid from the mass % HfO_2 to be 58.60 mass % or $3.456 \text{ mol kg}^{-1} \text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was equilibrated in a thermostated bath with the solvent. Equilibrium was established in 12-15 days. Samples of the saturated solutions were analyzed for Hf content gravimetrically as HfO_2 . Solid phase was characterized by chemical and microscopical analysis.	SOURCE AND PURITY OF MATERIALS: (1) $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was prepared from HfO_2 (99.33 mass% Hf, 0.55 mass% Zr). HfO_2 was heated to 300-450° with a mixture of $(\text{NH}_4)_2\text{SO}_4$ and concentrated H_2SO_4 , the melt was dissolved in water, and Hf was precipitated with NH_4OH . Hf hydroxide was washed free from sulfate ions, dissolved in concentrated HCl, and $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ obtained by crystallization. HCl used was reagent grade. (2) Grade "pure" methanol was used. Nothing was mentioned about drying the solvent.
ESTIMATED ERROR: Temp: precision $\pm 0.1 \text{ K}$. Solubility error is not specified.	

COMPONENTS: (1) Hafnium dichloride oxide octahydrate; $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$; [14456-34-9] (2) Ethanol; $\text{C}_2\text{H}_6\text{O}$; [64-17-5]	ORIGINAL MEASUREMENTS: Blinova, Z. N.; Komissarova, L. N. <i>Zh. Neorg. Khim.</i> <u>1972</u> , <i>17</i> , 2520-5. <i>Russ. J. Inorg. Chem. (Engl. Transl.)</i> <u>1972</u> , <i>17</i> , 1318-21.
VARIABLES: $T/K = 298$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p>The solubility of $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ at 25°C is reported to be 19.23 mass % HfO_2 or 37.40 mass % HfOCl_2. The equilibrium solid phase was $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$.</p> <p><i>NOTE:</i> The latter value apparently represents the solubility of the hydrated salt. From the mass % HfO_2 the compiler calculated the solubility of $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ to be 37.41 mass % or $1.460 \text{ mol kg}^{-1}$.</p>

VARIABLES: $T/K = 298$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p>The solubility of $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ at 25°C is reported to be 2.46 mass % HfO_2 or 4.78 mass % HfOCl_2. The equilibrium solid phase was $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$.</p> <p><i>NOTE:</i> The latter value apparently represents the solubility of the hydrated salt. From the mass % HfO_2 the compiler calculated the solubility of $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ to be 4.79 mass % or 0.123 mol kg^{-1}.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was equilibrated in a thermostated bath with the solvent. Equilibrium was established in 12-15 days. Samples of the saturated solutions were analyzed for Hf content gravimetrically as HfO_2 . Solid phase was characterized by chemical and microscopical analysis.	SOURCE AND PURITY OF MATERIALS: (1) $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ was prepared from HfO_2 (99.33 mass% Hf, 0.55 mass% Zr). HfO_2 was heated to 300-450° with a mixture of $(\text{NH}_4)_2\text{SO}_4$ and concentrated H_2SO_4 , the melt was dissolved in water, and Hf was precipitated with NH_4OH . Hf hydroxide was washed free from sulfate ions, dissolved in concentrated HCl , and $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ obtained by crystallization. HCl used was reagent grade. (2) Grade "pure" 1-hexanol was used. Nothing was mentioned about drying the solvent.
ESTIMATED ERROR: Temp: precision ± 0.1 K. Solubility error is not specified.	

COMPONENTS: (1) Hafnium dichloride oxide octahydrate; $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$; [14456-34-9] (2) 1-Heptanol; $\text{C}_7\text{H}_{16}\text{O}$; [111-70-6]	ORIGINAL MEASUREMENTS: Blinova, Z. N.; Komissarova, L. N. <i>Zh. Neorg. Khim.</i> <u>1972</u> , <i>17</i> , 2520-5. <i>Russ. J. Inorg. Chem. (Engl. Transl.)</i> <u>1972</u> , <i>17</i> , 1318-21.
VARIABLES: $T/K = 298$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p>The solubility of $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ at 25°C is reported to be 1.56 mass % HfO_2 or 3.02 mass % HfOCl_2. The equilibrium solid phase was $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$.</p> <p><i>NOTE:</i> The latter value apparently represents the solubility of the hydrated salt. From the mass % HfO_2 the compiler calculated the solubility of $\text{HfOCl}_2 \cdot 8\text{H}_2\text{O}$ to be 3.04 mass % or $0.0766 \text{ mol kg}^{-1}$.</p>	
AUXILIARY INFORMATION

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solutions of HF containing excess $\text{VOF}_2 \cdot 4\text{H}_2\text{O}$ were equilibrated for various time periods depending on the composition of the solid phases in equilibrium with the solution. The equilibrium time was 5-6 h for systems containing solid VO_2 and $\text{VOF}_2 \cdot 4\text{H}_2\text{O}$, whereas 2-3 days were necessary for those containing $\text{VOF}_2 \cdot 2\text{H}_2\text{O}$ and VOF_2 due to slow dehydration processes. Slow attainment of equilibrium prevented studies in solutions with > 81 mass% HF. V(IV) in the saturated solutions was determined by titration with KMnO_4 , F^- was determined by an unspecified potentiometric method. Solid phases were identified by chemical analysis.	SOURCE AND PURITY OF MATERIALS: (1) $\text{VOF}_2 \cdot 4\text{H}_2\text{O}$, pale-blue crystalline solid, was prepared by dissolving VO_2 (containing < 1% V(V)) in HF. Source and purity of materials used not specified.
	ESTIMATED ERROR: Nothing specified.

AUXILIARY INFORMATION					
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solutions of HF were equilibrated with excess V_2O_5 at 25°C ($C_{\text{HF}} < 41.3$ mass%) or 16°C ($C_{\text{HF}} > 44.2$ mass%) for 2-3 days. Paraffine coated and ebonite or Pt vessels were used for measurements at lower and higher HF concentration ranges, respectively. Samples of the solutions were taken into a weighed paraffine coated vessel containing water or ice. V was determined in the presence of F^- titrimetrically with KMnO_4 after reduction to V(III) with Zn amalgam in the presence of H_3BO_3 . F^- in the presence of V was determined by potentiometric titration with NaOH. Solid phases were identified by chem. analysis, the phase B also by microscopy.			SOURCE AND PURITY OF MATERIALS: V_2O_5 used reagent grade, source not specified.		
			ESTIMATED ERROR: Temp: precision ± 0.5 K at 298 K; precision ± 1 at 289 K. The solubility error is not specified.

AUXILIARY INFORMATION																			
METHOD/APPARATUS/PROCEDURE: <p>Method A is an isothermal method. Weighed amounts of UF_6 and excess VOF_3 were distilled into Fluorothene tubes under vacuum. Several such tubes were equilibrated with excess VOF_3 at 70°C for 1 week with hourly shaking each day. The tubes were allowed to stand undisturbed for two days while any excess VOF_3 floated to the top. Finally the tubes were quenched in liquid N, and their bottom sections, containing the saturated solution, were sealed off, dropped into water and analyzed for U and V. Methods of analysis not given. Method C: an excess of VOF_3 was added to pure UF_6 in a vapor-liquid apparatus and brought to equilibrium at 75°C. Samples of the liquid phase were analyzed for V. Method of analysis not given.</p>	SOURCE AND PURITY OF MATERIALS: (1) VOF_3 was prepared by the reaction of V_2O_5 with F gas at 450° according to ref (1), and de-gassed at liquid N temperature. It contained 40.9 - 41.3% V (calculated: 41.1%). (2) UF_6 , specification grade material from U.S.A.E.C., Oak Ridge. ESTIMATED ERROR: REFERENCES: 1. Haendler, H. M.; Bartram, S. F.; Becker, R. AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Teflon bottles equipped with stirrers and heavy fluoro-carbon hydraulic sealing were used. Solutions containing excess of hydrous Nb_2O_5 were equilibrated for at least 3-4 hr., in some experiments for 2 or more days. At high HF concentrations NbF_5 was used as the solute. In such cases the solutions were prepared by adding water to NbF_5 solution in anhydrous HF. Samples of saturated solutions were taken by and weighed in a Pt pipette after filtration in a Pt apparatus. Nb was determined gravimetrically as Nb_2O_5 after precipitation with tannin, F^- in the presence of Nb was titrated with NaOH against methyl red. Solutions containing > 80% HF, and the solid phases were analyzed for H_2O content by Fischer method modified for HF solutions (1). The composition of the solid phases was determined by chemical and microscopical analysis and also graphically from the phase diagram.	SOURCE AND PURITY OF MATERIALS: Nb_2O_5 was prepared from Nb metal by dissolving it in a mixture of HF + H_2O_2 and fluorination of the product with ClF_3 in liquid HF. The product was hydrolyzed to yield hydrous Nb_2O_5 . NbF_5 was prepared by fluorination with ClF_3 of Nb metal. Source and purity of starting materials not specified except for the Ta content (0.2 mol%) in Nb metal.
ESTIMATED ERROR: Temp: precision ± 0.1 K Soly: precision ± 2.5 %.

<p>EXPERIMENTAL VALUES:</p> <p>The authors report the solubility of NbF₅ in BrF₃ at 25 °C as (15.7 ± 0.01) g Nb/100 g solution or as the mole fraction of the species BrF₂⁺NbF₆⁻, $x = 0.341$.</p> <p>The compiler calculated the solubility of the species NbF₅ as 31.75 g/100 g solution or $m_1/\text{mol kg}^{-1} = 2.476$, and the species BrF₂⁺NbF₆⁻ solubility as $m/\text{mol kg}^{-1} = 3.75$.</p>	
<p>AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Isothermal method used. Measurements were carried out in a solubility apparatus made of Cu and brass, and consisting of a Cu mixing tube with a fritted Fluorothene filter disc at the bottom end to which a sampling compartment was connected. Excess NbF₅ was first mixed with BrF₃ in a quartz tube, and Br₂ and HF were removed by short evacuation. The slurry was then poured into the Cu mixing tube. The apparatus was assembled in a constant temperature air box which was lying on the rocker platform. The rocker was shaken for about 20 h. The displacement was such that at no time could the liquid come into contact with the filter disc. After equilibrium had been attained the box was turned upright, He pressure applied, and the saturated solution was forced through the filter into the weighed collecting tube. The sampling compartment was opened, the collecting tube sealed with a Fluorothene cap and weighed. The saturated solution was then hydrolyzed, Nb precipitated with cupferron, and ignited to Nb₂O₅.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) NbF₅ was prepared by fluorination by BrF₃ of Nb₂O₅ (source and purity not specified). The volatile impurities, Br₂ and HF, were removed under vacuum, and the resulting slurry was used as such.</p> <p>(2) BrF₃ (Harshaw Chem. Comp.) was purified from Br₂, HBr, BrF₅, HF, and nonvolatile fluorides by vacuum distillation in an all-nickel still. The fraction used (b.p. 95-95.5° at 250 mmHg) was pale yellow and was stored in Ni container. It was used in less than 3 days after distillation.</p> <p>ESTIMATED ERROR:</p> <p>Temp: precision ± 0.75 K.</p> <p>Soly: precision ± 0.6 %.</p>

COMPONENTS: (1) Niobium fluoride; NbF ₅ ; [7783-68-8] (2) (OC-6-11)-Uranium fluoride; UF ₆ ; [7783-81-5]	ORIGINAL MEASUREMENTS: Nikolaev, N. S.; Sadikova, A. T. <i>At. Ener.</i> <u>1975</u> , <i>39</i> , 338-43. <i>Sov. At. Energy (Engl. Transl.)</i> <u>1975</u> , <i>39</i> , 338-43.

AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solubility was determined in a Cu autoclave placed in a crucible furnace. Excess solid was equilibrated under constant mixing with 6 ml UF ₆ for 30-40 h, and then allowed to stand for another 40 h at the desired temperature, which exceeded 3-4 times the time necessary to reach the equilibrium. After that the autoclave was rapidly cooled in liquid N. A sample of the frozen saturated solution was transferred to ice to hydrolyze the components, and analyzed. Methods of analysis were not given. All procedures were carried out in a dry box at -20°C.	SOURCE AND PURITY OF MATERIALS: The fluorides were prepared by the authors. No details were specified except for the fact that the products were strictly anhydrous. ESTIMATED ERROR: Temp: precision ± 5 K. Solubility error is not specified. REFERENCES:

<p>CRITICAL EVALUATION:</p> <p>An evaluation of the solubility of NbO_2F in aqueous HF solutions.</p> <p>Nikolaev and Buslaev (ref 1) measured the solubility of either $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ or NbF_5 in aqueous HF solutions to nearly 100 % HF at 293 K. Ferris (ref 2) measured the solubility of NbO_2F in aqueous HF solutions up to about 24 mass percent HF at 298 K. Although the data were measured at temperatures that differed by five degrees, the results (Figure 1) agree well enough to believe that the same system is being studied by the two laboratories over the common part of the HF range.</p> <p>Nikolaev and Buslaev equilibrated their mixtures from 3-4 hours up to two days. They reported the equilibrium solid to be $\text{Nb}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$. Ferris equilibrated the system for up to four months. His data shows less scatter than the data of Nikolaev and Buslaev. Ferris carefully characterized the solid as NbO_2F by both chemical analysis and by X-ray diffraction. The evaluator accepts what appears to be the more careful work of Ferris that NbO_2F is the thermodynamically stable solid. Ferris' data is preferred over the 0 to 24 mass percent HF range. Ferris points out that if Nikolaev and Buslaev used a very large excess of $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ over HF that all of the HF could have been consumed without markedly depleting the oxide present. This could explain the difference in the identification of the solid phase.</p> <p>REFERENCES:</p> <ol style="list-style-type: none"> 1. Nikolaev, N. S.; Buslaev, Yu. A. <i>Zh. Neorg. Ferris, L. M.

J. Chem. Eng. Data 1966, 11,
343-6.

EXPERIMENTAL VALUES:

NOTE: (continued) The solubilization of Nb_2O_5 proceeded via the equilibrium

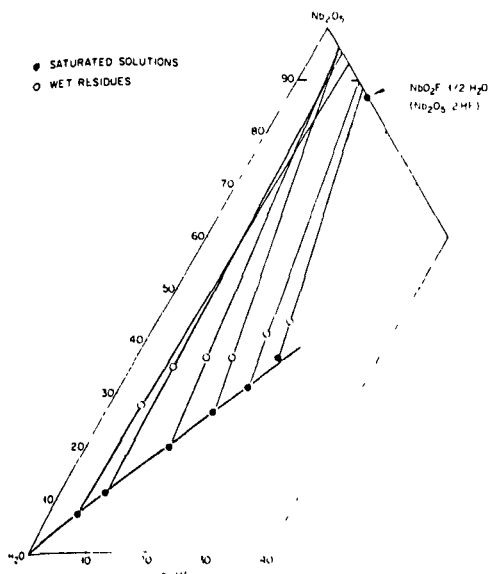

Both sets of data (starting with either $\text{Nb}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ or $\text{NbO}_2\text{F} \cdot (1/2)\text{H}_2\text{O}$ as the solid) fit a single straight line when the niobium concentration in the saturated solution is plotted against the total fluorine concentration. This indicates that the NbO_2F is the thermodynamically stable solid phase.

See the figures below.

Solubility of niobium in hydrofluoric acid solutions at 25°C

VARIABLES: $T/K = 298$ HF Concentration Starting solid	PREPARED BY: J. Hála
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal. Excess of either hydrous Nb ₂ O ₅ · $\frac{1}{2}$ H ₂ O or NbO ₂ F· $\frac{1}{2}$ H ₂ O was equilibrated with HF solutions. Solutions containing initially hydrous Nb ₂ O ₅ attained equilibrium in a few days, equilibration of systems containing initially NbO ₂ F· $\frac{1}{2}$ H ₂ O required nearly 2 years. After equilibration samples of the saturated solutions were clarified by centrifugation at 25°, and analyzed. Solid phases were recovered by filtration, washed with water and air-dried. Their composition was determined by chemical analysis and x-ray diffraction. Solid phases from solutions equilibrated with hydrous Nb ₂ O ₅ were also identified by the method of wet residues. Nb in solutions and solid phases was determined by both x-ray absorption (ref 1) and by ignition of samples to Nb ₂ O ₅ . Total F in solutions and in wet residues was determined by differential potentiometric titration with NaOH (ref 2). In solid compounds F was also determined by pyrohydrolysis (refs 3,4) after drying the sample in the presence of a mixture of WO ₃ and Na ₂ WO ₄ . The concentration of free F ⁻ in solutions was determined by spectrophotometric titration with Th(IV) solution as a titrant, and SPDNS as the indicator (ref 5). Raman spectra of selected saturated solutions were recorded to confirm the presence of the NbOF ₂ ⁻ ion.	SOURCE AND PURITY OF MATERIALS: (1) Hydrated NbO ₂ F was obtained by dissolving high purity Nb metal in boiling 16 mol dm ⁻³ HNO ₃ + 1 mol dm ⁻³ HF (F:Nb atom ratio < 5) in a teflon vessel. The product was filtered, washed with acetone, and dried first in air and then over Drierite. Analysis (mass. %): found Nb 61.6, F 12.4, H ₂ O 5.12; calculated for NbO ₂ F· $\frac{1}{2}$ H ₂ O Nb 60.8, F 12.4, H ₂ O 5.89. The existence of the hydrate was confirmed by ir analysis. Hydrous Nb ₂ O ₅ was obtained by dissolving sintered Nb ₂ O ₅ (Kawecki Chem. Co.; total metal impurities < 300 ppm) in HF, and precipitating the hydrous oxide with NH ₄ OH. The precipitate was alternately washed with water and 0.1 mol dm ⁻³ HNO ₃ and air-dried at room temperature. It contained about 50% Nb, 25% H ₂ O, 0.1% F, and < 0.5% N. (2) HF, reagent grade. (3) Distilled water was used.
ESTIMATED ERROR: Temp: precision ± 1 K. Soly: precision ± 3 % as Nb.	REFERENCES: (1) Dunn, H. W. <i>Anal. Chem.</i> <u>1962</u> , <i>34</i> , 116. (2) Nikolaev, N. S.; Buslaev, Yu. A. <i>Russ. J. AUXILIARY INFORMATION																																																				
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess of hydrous Nb ₂ O ₅ was equilibrated with HF/HNO ₃ solutions for about 1 year. After equilibration samples of the saturated solutions were clarified by centrifugation at 25°, and analyzed. Nb was determined by both x-ray absorption (ref 1) and by ignition of samples to Nb ₂ O ₅ . Total F content was determined by differential potentiometric titration with NaOH (ref 2). Solid phases were identified by x-ray diffraction.	SOURCE AND PURITY OF MATERIALS: (1) Hydrous Nb ₂ O ₅ was obtained by dissolving sintered oxide (Kawecki Chem. Co., total metal impurities < 300 ppm) in HF, and precipitating the hydrous oxide with NH ₄ OH. The precipitate was washed alternately with water and 0.1 mol dm ⁻³ HNO ₃ and air-dried at room temperature. It contained about 50% Nb, 25% H ₂ O, 0.1% F, and < 0.5% N. (2) HF, reagent grade. (3) HNO ₃ , reagent grade. (4) Distilled water was used.																																																			
ESTIMATED ERROR: Temp: precision ± 1 K. Soly: precision ± 3 % as Nb.	REFERENCES: (1) Dunn, H. W. <i>Anal. Chem.</i> <u>1962</u> , <i>34</i> , 116. (2) Nikolaev, N. S.; Buslaev, Yu.A. <i>Russ. J. Inorg. Chem.</i> <u>1959</u> , <i>4</i> , 84.																																																			

<p>COMPONENTS:</p> <p>(1) Silver hexafluoronioabate(1-); AgNbF₆; [12062-11-2]</p> <p>(2) Hydrogen fluoride; HF; [7664-39-3]</p>	<p>ORIGINAL MEASUREMENTS:</p> <p>Gut, R.; Rueede, J. <i>J. Coord. Chem.</i> <u>1978</u>, 8, 47-53.</p>
<p>VARIABLES:</p> <p style="text-align: center;">T/K = 273</p>	<p>PREPARED BY:</p> <p style="text-align: center;">J. Hála</p>
<p>EXPERIMENTAL VALUES:</p> <p>Both the solubility and solubility product of AgNbF₆ in liquid HF at 0 °C are reported. The values are 0.752 g in 100 g HF from which the compiler calculated $m_1/\text{mol kg}^{-1} = 0.0239$, and $-\log K_{s0} = 3.01$.</p>	
<p>AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Solubility was determined by isothermal method followed by chemical analysis of saturated solutions. Details were not reported. The solubility product was obtained from titrations of solutions of KNbF₆ in HF with a AgF solution in HF during which solid AgNbF₆ was formed. Details of calculations not reported. In the titrations the [Ag⁺]/[NbF₆] ratio varied 10-50-fold and the ionic strength varied within $0.15 \pm 0.03 \text{ mol dm}^{-3}$ due to changes in supporting electrolyte concentration. The titrations were carried out in a Kel-F apparatus with a burette made of a precision drilled Kel-F rod, using a Ag indicator electrode and Ag/AgBF₄(sat)/KBF₄(sat)/HF or Ag/AgNbF₆(sat)/liquid HF systems as reference electrodes. The titration apparatus was handled at 0° in a refrigerator. The Ag electrode responded reversibly to the concentration of free Ag⁺ ions over the range of pAg = 1.5-20. Equilibrium potentials were reached in seconds and were constant over long periods of time.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) AgNbF₆ was prepared from AgF and NbF₅ in anhydrous HF and recrystallized. NbF₅ used was prepared by condensing excess HF onto freshly sublimed NbCl₅, and subliming the crude NbF₅ in vacuum. AgF used was prepared by evaporation of HF from AgHF₂ which in turn was prepared in the following way. Excess HF gas was condensed on a wet filter cake of freshly precipitated Ag₂O and the solution obtained was evaporated to dryness by heating at 150° in a stream of N gas. The residue was dissolved in anhydrous HF, cooled to -78° to obtain crystals of AgF.5HF which decomposed to AgHF₂ on heating to 25°.</p> <p>(2) Anhydrous HF distilled from commercial (source not specified) 99.9% product in steel tanks was redistilled 2-3-times over AgF to remove traces of H₂S. The conductivity of the product corresponded to water content $< 10^{-4} \text{ mol dm}^{-3}$.</p>
<p>ESTIMATED ERROR:</p> <p>Error of solubility product $\pm 0.04 \text{ log units (reproducibility)}$</p> <p>Temperature and solubility errors are not reported. The authors stated that the solubility calculated from K_{s0} was somewhat higher than the isothermal value, due to the salt effect.</p>

AUXILIARY INFORMATION																																									
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solubility measurements were carried out in a Ag vessel. Mixtures were equilibrated by stirring for 7-10 hours. Four samples were taken from each saturated solution. In 2 of them the sum of free HF and Nb was titrated with alkali against methylorange in the presence of CaCl_2 . In the other 2 samples Nb was determined gravimetrically as Nb_2O_5 after evaporation of the sample with $\text{H}_2\text{SO}_4 + \text{H}_3\text{BO}_3$ mixture and hydrolytic precipitation of niobic acid. In the filtrate K was determined gravimetrically as K_2SO_4 after evaporation of the filtrate with HF+ H_2SO_4 to remove H_3BO_3 . Free HF content was obtained by difference. Independent experiments showed that 5 moles of alkali were consumed per 1 mole Nb.	SOURCE AND PURITY OF MATERIALS: (1) KNbF_6 was prepared from Nb metal of unspecified source and purity. The metal was dissolved in HF+ HNO_3 mixture, the solution was evaporated to a small volume and by addition of a 70-80% HF solution the HF concentration was adjusted to 50-60%. KNbF_6 was precipitated by addition of a solution of KHF_2 in 50-60% HF. The product was recrystallized from 50-55% HF, analysis not reported. (2) Concentrated HF was obtained by distillation of a mixture of equal volumes of 40% HF and concentrated H_2SO_4 .																																								
	ESTIMATED ERROR: Temp: precision ± 0.1 K. Solubility error is not specified.

AUXILIARY INFORMATION								
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess of K_2NbF_7 was shaken in Pt bottles with either water or a HF solution for 3 hours and filtered through a Pt funnel. In one aliquot of the filtrate, Nb and free HF were determined alkametrically according to ref (1); in another, Nb was determined gravimetrically as Nb_2O_5 after precipitation with NH_3 solution. Precipitation was repeated twice (after dissolution of hydrous Nb_2O_5 in HF) to remove adsorbed potassium, and in the collected filtrates potassium was determined (method not specified). Solid phases were identified by optical microscopy.					SOURCE AND PURITY OF MATERIALS: (1) K_2NbF_7 (source or method of preparation not specified) was separated from K_2TaF_7 according to (ref 2), then repeatedly recrystallized from concentrated HF solution and finally dried at 120° to remove HF. (2) HF solutions were prepared from nonaqueous HF to avoid the presence of H_2SiF_6 .			
					ESTIMATED ERROR: Nothing specified.

Continued on the next page . . .

<p>COMPONENTS:</p> <p>(1) Dipotassium heptafluoro-niobate(2-); K_2NbF_7; [16924-03-1]</p> <p>(2) Hydrogen fluoride; HF; [7664-39-3]</p> <p>(3) Water; H_2O; [7732-18-5]</p>	<p>ORIGINAL MEASUREMENTS:</p> <p>Savchenko, G. S.; Tananaev, I. V.</p> <p><i>Zh. Prikl. Khim.</i> 1946, 19, 1093-1105 (measurements at 298 K)</p> <p><i>Zh. Prikl. Khim.</i> 1947, 20, 385-90. (measurements at 348 K)</p>
<p>EXPERIMENTAL VALUES:</p> <p>Note:</p> <p>In experiments with equilibrium HF concentration < 6.60 mass%, HF was not added to the initial mixtures. The increasing HF concentration in these measurements was the result of increasing amount of K_2NbF_7 introduced into the initial mixture. Increasing solubility of Nb in this region is explained by gradual stabilization of the NbF_5^- ion in the solution on increasing equilibrium HF concentration:</p> $K_2NbOF_5 + 2 HF \rightarrow K_2NbF_7 + H_2O$ <p>Another increase in solubility observed at equilibrium HF concentration > 27 mass% was explained by the formation of the NbF_6^- ion in solution, and finally also in the solid phase:</p> $K_2NbF_7 + HF \rightarrow KNbF_6 + KHF_2$ <p>The solubility in this region represents the solubility of $KNbF_6$ in HF solutions containing KHF_2.</p>	
<p style="text-align: center;">AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Isothermal method used. Solubility measurements were carried out in a Ag vessel. Mixtures were equilibrated with stirring for 7-10 hours at 25°C or for 4 hours at 75°C. In measurements with equilibrium HF concentration ≤ 6.60 mass%, K_2NbF_7 was equilibrated with water only. Samples of saturated solutions were analyzed for Nb, K, and free HF. Nb was determined gravimetrically as Nb_2O_5 after evaporation of the sample with $H_2SO_4 + H_3BO_3$ and hydrolytic precipitation of niobic acid. In the filtrate K was determined gravimetrically as K_2SO_4 after evaporation of the filtrate with HF + H_2SO_4 to remove H_3BO_3. In another aliquot of the saturated solution, the sum of free HF and Nb were titrated with alkali against methyl orange in the presence of $CaCl_2$. Free HF content was obtained by difference. Independent experiments showed that 5 moles of alkali are consumed per 1 mole of Nb. K_2NbF_7 as the solid phase was deduced from the fact that the NbF_5^-/KF mole ratio was close to 2 in the corresponding HF concentration ranges. Nothing was mentioned about the identification of $KNbF_6$ and $K_2NbOF_5 \cdot H_2O$.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) K_2NbF_7 was prepared by addition of KF to a HF solution of NbF_5. The product was filtered, washed with water-alcohol mixture containing HF, then with pure alcohol, and recrystallized from 10% HF, and dried at 110°C. On drying K_2NbF_7 lost HF continuously turning partly into $K_2NbOF_5 \cdot H_2O$. According to authors this was not important for the solubility measurements. NbF_5 was prepared by dissolving Nb metal (unspecified origin and purity) in a mixture of HF + HNO_3 and subsequent evaporation of HNO_3.</p> <p>(2) HF used for mixtures containing up to 35 mass% HF was prepared from 40% acid obtained from the acid doubly distilled in a Pt apparatus. Mixtures with higher HF content were prepared from 60-90 mass% HF obtained by distillation of a mixture of equal volumes of 40% HF and concentrated H_2SO_4.</p> <p>ESTIMATED ERROR:</p> <p>Temp: precision ± 0.1 K. The solubility error is not specified.</p>

COMPONENTS:				ORIGINAL MEASUREMENTS:			
(1) Dipotassium heptafluoroniobate (2-); K_2NbF_7 ; [16924-03-1]				Ruff, O.; Schiller, E.			
(2) Potassium fluoride; KF; [7789-23-3]				Z. Anorg. Chem. <u>1911</u> , 72, 329-57.			
(3) Water; H_2O ; [7732-18-5]							
VARIABLES: $T/K = 289, 353$ Composition				PREPARED BY: J. Hála			
EXPERIMENTAL VALUES: Composition of the saturated solutions.							
Temperature		KF		NbF_5	Nb^C	$K_2NbOF_5^C$	Nature of the Solid Phase ^f
$t/^\circ C$	T/K	mass% ^a	mass% ^b	mass%	mass%	mass% $m_1/mol\ kg^{-1d}$	
16	289	7.41	5.54	1.16	0.573	1.74	A
16	289	7.39	6.04	2.67	1.320	e	A+B
80	353	4.81	10.08	11.66	5.765	17.51	A+C
<p>^a Initial concentration.</p> <p>^b Equilibrium concentration found by analysis. At 16^oC it was lower than the concentration of KF used initially. The authors explained this by the formation of a new solid phase richer in K than both K_2NbF_7 and $K_2NbOF_5 \cdot H_2O$ which, however, could not be detected by optical microscopy. The value at 80^o corresponds to the sum of concentrations of KF used and of K dissociated from the salt dissolved.</p> <p>^c Calculated by compiler for the salt corresponding to the equilibrium solid phase (K_2NbOF_5).</p> <p>^d Equilibrium mass% KF corrected for K dissociated from K_2NbOF_5 dissolved.</p> <p>^e Not calculated because of the coexistence of two soluble solid phases.</p> <p>^f A: $K_2NbOF_5 \cdot H_2O$; B: K_2NbF_7 [16924-03-1]; C: unidentified solid phase.</p> <p>Note: There is some uncertainty about the two measurements at 16^o. With initially the same KF concentration, different solid phases were reported. For the measurement with 7.39 mass% KF the saturated solution was reported to contain also 5.39 mass% HF although it was stated that K_2NbF_7 was shaken with solutions containing KF only.</p>							
AUXILIARY INFORMATION							
METHOD/APPARATUS/PROCEDURE:				SOURCE AND PURITY OF MATERIALS:			
Isothermal method used. Excess K_2NbF_7 was shaken with KF solutions for 3 hours in Pt bottles and filtered through a Pt funnel. In the filtrate Nb was determined gravimetrically as Nb_2O_5 after precipitation with NH_3 solution. Precipitation was repeated twice (after dissolution of hydrous Nb_2O_5 in HF) to remove adsorbed K, and in the collected filtrates K was determined (method not specified). Solid phases were identified by optical microscopy.				(1) K_2NbF_7 (source and purity not specified) was first separated from K_2TaF_7 according to ref (1), and then repeatedly recrystallized from concentrated HF solution and finally dried at 120 ^o to remove HF.

AUXILIARY INFORMATION																																																									
METHOD/APPARATUS/PROCEDURE: As in the authors' previous work (ref 1) isothermal method was used. Excess K_2NbF_7 was equilibrated with KF-HF solutions in a Ag vessel by stirring for 8 hours. Saturated solutions were analyzed for Nb gravimetrically as Nb_2O_5 after evaporation of the sample with a mixture of $H_2SO_4 + H_3BO_3$ and hydrolytic precipitation of niobic acid. Solid phases were not investigated.	SOURCE AND PURITY OF MATERIALS: (continued) stated that on drying K_2NbF_7 lost HF continuously turning partly to $K_2NbOF_5 \cdot H_2O$. (2) HF used was prepared from 40% HF obtained from the acid doubly distilled from a Pt apparatus.																																																								
SOURCE AND PURITY OF MATERIALS: (1) K_2NbF_7 was prepared by addition of KF to a HF solution of NbF_5 (the latter was prepared by dissolving Nb metal of unspecified source and purity in a mixture of HF + HNO_3 and subsequent evaporation of HNO_3). The product was filtered, washed with water-alcohol mixture containing HF, then with pure alcohol, recrystallized from 10% HF, and dried at 110°C. The authors	ESTIMATED ERROR: Temp: precision ± 0.1 K. Solubility error not specified. REFERENCES: 1. Savchenko, G. S.; Tananaev, I. V. <i>Zh. Prikl. AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: No details given.	SOURCE AND PURITY OF MATERIALS: (1) $K_2NbOF_5 \cdot H_2O$ was prepared from mixed Nb+Ta oxides obtained from the mineral columbite of different localities. From it, a mixture of $K_2NbOF_5 \cdot H_2O$ and K_2TaF_7 was prepared by dissolving the oxides in a solution of HF and adding KF. The two salts were separated by repeated crystallization making use of the difference in their solubilities. Pure $K_2NbOF_5 \cdot H_2O$ was obtained as thin rhomboedral plates. Analysis (mass%): found H_2O 5.87, Nb 31.12, K 25.92, F 31.72; calculated H_2O 5.98, Nb 31.23, K 25.91, F 31.56. ESTIMATED ERROR: Temp: precision ± 2 K.

METHOD/APPARATUS/PROCEDURE: Isothermal method. The Pyrex glass apparatus (ref 1) consisted of the solvent pretreatment line, the saturation, and the sampling vessels. In the pretreatment section, the solute was repeatedly pretreated by successive sublimations of the halide and condensation at -195°C of the solvent onto it. Both components were transferred into the saturation vessel which was connected to the sampling compartment through a sintered glass disc. The vessel was rocked for 24 h, the saturated solution filtered into the sampling ampoule which was then sealed off, weighed, and broken under water to hydrolyze the halide. After standing for 4-5 h, the solution was heated to 90°C, cooled and filtered, and the oxide was ignited and weighed.	SOURCE AND PURITY OF MATERIALS: (1) NbCl ₅ was prepared from pure metal sheet and dry Cl gas at 300-350°C (ref 2). The product was purified by 5 or 6 fractional sublimations <i>in vacuo</i> , and finally sublimed into fragile hook-ended ampoule. (2) Diethylether (anesthetic) was distilled from 1/5 of its volume of H ₂ SO ₄ , kept over P ₂ O ₅ for at least a week, decanted, fractionated under dry N gas, and stored over Na wire. ESTIMATED ERROR: Temp: precision ± >0.1 K. Solubility error is not specified. REFERENCES: 1. Fairbrother, F.; Scott, N.; Prophet, H. <i>J. Chem. Soc., London</i> <u>1956</u> , 1164. 2. Alexander, K. M.; Fairbrother, F. <i>J. Chem. Soc., London</i> <u>1949</u> , S 223.																																

COMPONENTS: (1) Niobium chloride; NbCl_5 ; [10026-12-7] (2) 4-Methyl-1,3-dioxalan-2-one (propylene carbonate); $\text{C}_4\text{H}_6\text{O}_3$; [108-32-7]	ORIGINAL MEASUREMENTS: Harris, W. S. <i>U. S. At. Energy Comm. Report</i> <u>UCRL-8381</u> , 1958, 77 pp. <i>Chem. Abstr.</i> 1959, 53, 4966b.
VARIABLES: <i>T/K</i> = 298	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p style="text-align: center;">The solubility of NbCl_5 in propylene carbonate at 25 °C was estimated to be approximately 85 g NbCl_5/100 g of solvent. The compiler calculated a molal solubility of $m_1/\text{mol kg}^{-1} = 3.15$.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: An isothermal method was used. Saturated solutions were prepared by agitating excess solid with the solvent for at least three days in a glass cell shaped in the form of an inverted T with a ball-joint cap. The cell was thermostated in a water bath. Atmospheric moisture was excluded by use of a dry box. The method of Nb determination in the saturated solutions was not specified.	SOURCE AND PURITY OF MATERIALS: (continued) 50 mmHg and a reflux ratio of 5:1. Small portions containing high and low boiling impurities were re-fractionated at 20 mmHg and a reflux ratio from 15:1 to 25:1. The middle 4/5 of this was used.
SOURCE AND PURITY OF MATERIALS: (1) NbCl_5 (Stauffer Chemical Co., purity not specified) was used without purification. (2) Propylene carbonate (Jefferson Chemical Co.) was purified by fractionating the solvent twice. The first fractionation was conducted at	ESTIMATED ERROR: Temp: precision ± 0.01 K. The solubility value reported is considered only an approximate estimate. REFERENCES:

AUXILIARY INFORMATION													
METHOD/APPARATUS/PROCEDURE: Isothermal method. Excess NbCl_5 was introduced to the solvent in a dry box. The mixture was equilibrated for 5-10 days in a thermostated vessel equipped with a hydraulic stopper to prevent both solvent evaporation and access of atmospheric moisture. Attainment of equilibrium was checked by analyzing the liquid phase for Nb in samples taken periodically over 15 days. Nb in the sample was determined gravimetrically as Nb_2O_5 either after direct ignition of the samples of the saturated solutions or after extraction of Nb into concentrated HCl and subsequent precipitation of the hydrated oxide.	SOURCE AND PURITY OF MATERIALS:(continued) emission spectrography; impurities not specified. (2) Hexachloro-1,3-butadiene (source not specified) was purified to obtain a product with $d_4^{20} = 1.6807$ and $n_D^{20} = 1.5543$.												
SOURCE AND PURITY OF MATERIALS: (1) NbCl_5 was prepared by chlorination of Nb metal with Cl gas at $250-500^\circ$. M.p. 204° . The product was stored in a dry box. The purity of Nb metal used was 99.0-99.5% as determined by	ESTIMATED ERROR: Temp: precision ± 0.1 K. Soly: precision $\pm 0.2-0.5$ %. REFERENCES:

COMPONENTS: (1) Niobium chloride; NbCl ₅ ; [10026-12-7] (2) Titanium chloride; TiCl ₄ ; [7550-45-0]	EVALUATOR: J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61 137 Brno, Czechoslovakia
CRITICAL EVALUATION: An evaluation of the solubility of NbCl ₅ in TiCl ₄ at temperatures between 273 and 373 K. Five sets of data are available for the temperature dependence of the solubility of NbCl ₅ in TiCl ₄ (ref 1-5). In all of the papers the solubility values were determined by an isothermal method and by analysis of the saturated solutions. In two cases (ref 2, 3) a polythermal method was also used in the region of higher solubilities. The solubility values obtained by the isothermal method are compared in Figure 1. Of these, the data of Tarasenkov and Komandin (ref 1) are much lower than the data of the other authors. The authors (ref 1) themselves state the low precision of their data, and these data can be rejected. [The poor quality of their data can be seen in the NbCl ₅ /TaCl ₅ solubility ratio in TiCl ₄ they report. Their values show TaCl ₅ being 25 to 60 times more soluble than NbCl ₅ (in mass %). The solubility ratio from other workers (ref 2-5) show the two solutes have solubilities of the same order of magnitude, which one would expect from the properties of Nb and Ta.] It is not possible to give preference to any of the remaining four sets of data. Figure 1 show some regions of fair agreement. The data of Niselson and Perekhrest (ref 3) show fair agreement with the data of Morozov and Toptygin (ref 2) over the temperature range of 15 to 40 °C, and good agreement with the value of Long (ref 5) at 60 °C. It is worth noting that direct, although different, methods of analysis of the solutions were used in (ref 2, 3, 5), but that an indirect analysis (based on the sum of Ti and Nb and the total chloride content) was employed in (ref 4). The two data sets obtained by the polythermal method (ref 2, 3) differ considerably. The values of Niselson and Perekhrest (ref 3) are 5 to 10 mass% NbCl ₅ lower at a given temperature than the values of Morozov and Toptygin (ref 2). There are two possible explanations for the difference. There is a strong tendency to form supersaturated solutions in the NbCl ₅ + TiCl ₄ systems (ref 3) which prevents the liquidus temperature to be determined from cooling curves with reasonable accuracy. It has also been pointed out (ref 2) that the presence of NbCl ₃ O in the NbCl ₅ could lead to erroneous interpretation of the cooling curves since precipitation of NbCl ₃ O could be mistakenly taken for the first appearance of crystals of NbCl ₅ . Morozov and Toptygin (ref 2) took great care to remove NbCl ₃ O from the NbCl ₅ used in their measurements. REFERENCES: 1. Tarasenkov, P. N.; Komandin, A. V. <i>Zh. Obshch. AUXILIARY INFORMATION																																																																					
METHOD/APPARATUS/PROCEDURE: <p>Solubilities over the temperature range of 18-106° were obtained by isothermal method. Mixtures of TiCl₄ and NbCl₅ were distilled into a test-tube with a side arm. The test-tube was sealed off, kept at the desired temperature for 20-40 h, and a part of the saturated solution was poured into the side arm. The latter was then sealed off, cooled, and weighed. Prior to analysis, most of the TiCl₄ was removed by distillation in the presence of NaCl. The final separation of Nb from the remaining Ti was achieved by means of phenylarsonic acid. The solubilities above 110° were obtained from thermal analysis. The mixtures of TiCl₄ and NbCl₅ were prepared by weighing, melted, and cooling curves were recorded.</p>	SOURCE AND PURITY OF MATERIALS: (1) NbCl ₅ was prepared by chlorination with Cl gas of Nb metal (source and purity not specified). The product was repeatedly passed in a stream of Cl gas over heated carbon to convert eventual NbCl ₃ O into NbCl ₅ , and contained finally approximately 0.01% NbCl ₃ O. (2) Commercially available TiCl ₄ (source not specified) was distilled twice. The fraction boiling at 136°C at 760 mmHg was used.																																																																				
ESTIMATED ERROR: Nothing specified.

AUXILIARY INFORMATION				
METHOD/APPARATUS/PROCEDURE: At higher (>4.87 mass%) NbCl ₅ concentrations, the liquidus curve was obtained by visual polythermal method. NbCl ₅ and TiCl ₄ were weighed into a glass tube previously dried <i>in vacuo</i> at 350-400°C. The tube was sealed, heated in a furnace to melt the mixture, and then allowed to cool slowly in a thermostated glycerine bath under constant rotation at 60 rpm. The liquidus temp. was taken as the average of temperatures of appearance and disappearance of crystals in the melt recorded at successive cooling and heating of the system. At lower NbCl ₅ concentrations, isothermal method was used. Ampoules containing TiCl ₄ and NbCl ₅ were equilibrated for 30 h at 40 and 60°C, and for 60 h at 0 and 17.5°C. A sample of the saturated solution was hydrolyzed, the precipitate ignited to oxides, and the Nb concentration was determined spectrographically. The eutectic temp. was calculated according to (3).		SOURCE AND PURITY OF MATERIALS: Source of TiCl ₄ and NbCl ₅ not specified. The halides were purified by rectification and were stored in sealed ampoules.		
		ESTIMATED ERROR: Nothing specified.

AUXILIARY INFORMATION																					
METHOD/APPARATUS/PROCEDURE: Saturated solutions were prepared in a sealed, N filled apparatus (1), for 21-90 hr. After equilibration, a sample of the filtered saturated solution was collected in a detachable ampoule. Dissolving and sampling operations were carried out in a thermostated waterbath. Each ampoule with the sample was broken under 3N HNO ₃ in a sealed bottle, and hydrous oxides of Nb+Ti were precipitated by NH ₃ . After filtration and ignition at 800°C, the mixed oxides were analyzed x-ray spectrographically.	SOURCE AND PURITY OF MATERIALS: (1) NbCl ₅ , laboratory grade (Alfa Inorganics) was used as obtained. (2) TiCl ₄ (source not specified) was purified by treatment with Cu powder and distillation, and collected in sealed ampoules. ESTIMATED ERROR: Temp: precision ± 0.5 K. Soly: precision ± 2 %. REFERENCES: 1. Long, A. M. <i>Chem. Ind.</i> <u>1968</u> , <i>50</i> , 1764.																				

COMPONENTS: (1) Niobium Chloride oxide; NbCl ₃ O; [13597-20-1] (2) Niobium chloride; NbCl ₅ ; [10026-12-7]	EVALUATOR: J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61137 Brno, Czechoslovakia October 1985
CRITICAL EVALUATION: The solubility of niobium chloride oxide in niobium chloride. Two papers (ref 1 and 2) report measurements of the solubility of NbCl ₃ O in NbCl ₅ by a polythermal method. The two data sets differ considerably. The liquidus curve of Niselson and Gavrilov (ref 2) is at a much higher temperature than that of Meyer and coworkers (ref 1). The reason for the discrepancy is not clear and it is not possible to give one data set preference over the other. The two papers do agree well on the eutectic temperature which is given as 203.3-203.4 (ref 1) and 203 (ref 2) °C. REFERENCES: 1. Meyer, G.; Oosterom, J. F.; VanOeveren, W. J. <i>Rec. Trav. METHOD/APPARATUS/PROCEDURE: Polythermal method. Mixtures of NbOCl_3 and NbCl_5 were condensed into evacuated tubes under exclusion of atm. moisture. The tubes were sealed and slowly warmed up under shaking in a salt bath until the solid phase disappeared. Temperature was measured by using calibrated Anschütz thermometers.	SOURCE AND PURITY OF MATERIALS: Source of NbCl_5 and NbOCl_3 was not specified. Only negligible traces of impurities were detected in the chemicals by spectrographic analysis. Contrary to other authors (1,2) it was not possible to obtain pure NbCl_5 by distn. and subsequent sublimation. The product contained 97.4 mass % NbCl_5 at the most, the rest being NbOCl_3 .

AUXILIARY INFORMATION																																	
METHOD/APPARATUS/PROCEDURE: Isothermal method. The Pyrex glass apparatus (ref 1) consisted of the solvent pretreatment line, the saturation, and the sampling vessels. In the pretreatment section, the solute was repeatedly pretreated by successive sublimations of the halide and condensation at -195°C of the solvent onto it. Both components were transferred into the saturation vessel which was connected to the sampling compartment through a sintered glass disc. The vessel was rocked for 24 h, the saturated solution filtered into the sampling ampoule which was then sealed off, weighed, and broken under water to hydrolyze the halide. After standing for 4-5 h, the solution was heated to 90°C , cooled and filtered, and the oxide was ignited and weighed.	SOURCE AND PURITY OF MATERIALS: (1) NbBr_5 free from hydrolytic products was prepared by reacting dry Br with Nb metal sheet in a closed system at $400-450^\circ\text{C}$. The product was purified by 5 or 6 fractional sublimations <i>in vacuo</i> , and finally sublimed into fragile hook-ended ampoule. (2) Diethylether (anesthetic) was distilled from 1/5 of its volume of H_2SO_4 , kept over P_2O_5 for at least a week, decanted, fractionated under dry N gas, and stored over Na wire. ESTIMATED ERROR: Temp: precision $\pm >0.1$ K. Solubility error is not specified. REFERENCES: 1. Fairbrother, F.; Scott, N.; Prophet, H. <i>J. Chem. Soc.</i> , London <u>1956</u> , 1164.

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:

Isothermal method used. The procedure was essentially that used for the analogous NbF₅/HF/H₂O system (ref 1). Teflon bottles equipped with stirrers and heavy fluorocarbon hydraulic sealing were used. Solutions containing excess hydrous Ta₂O₅ were equilibrated for at least 3-4 h, in some experiments for 2 or more days. At high HF concentrations TaF₅ was used as the solute. In such cases the solutions were prepared by adding water to TaF₅ solutions in anhydrous HF. Samples of saturated solutions were taken by and weighed in a Pt pipette after filtration in a Pt apparatus. Ta was determined gravimetrically as Ta₂O₅, F⁻ in the presence of Ta was titrated with NaOH against phenolphthaleine. Solutions containing high HF concentrations and the solid phases were analyzed for H₂O by Fischer method modified for HF solutions (ref 2). The composition of the solid phases was determined by chemical and microscopical analysis and also by the method of wet residues.

SOURCE AND PURITY OF MATERIALS:

(1) TaF₅ was prepared by fluorination with ClF₃ of Ta metal (source and purity not specified except for the Nb content, 0.34%). Hydrous Ta₂O₅ was obtained by hydrolyzing a solution of Ta in liquid HF.

ESTIMATED ERROR:

Temp: precision ± 0.1 K.
Soly: precision ± 1 % in Ta;
precision ± 2.5 % in F⁻.

VARIABLES: $T/K = 373$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p style="text-align: center;">At 100°C the solubility of TaF₅ in UF₆ is reported to be 0.10 mol kg⁻¹ (2.86 mass %).</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: <p>Isothermal method used. Solubility was determined in a Cu autoclave placed in a crucible furnace. Excess solid was equilibrated under constant mixing with 6 ml UF₆ for 30-40 h, and then allowed to stand for another 40 h at the desired temperature, which exceeded 3-4 times the time necessary to reach the equilibrium. After that the autoclave was rapidly cooled in liquid N. A sample of the frozen saturated solution was transferred to ice to hydrolyze the components, and analyzed. Methods of analysis were not given. All procedures were carried out in a dry box at -20°C.</p>	SOURCE AND PURITY OF MATERIALS: <p>The fluorides were prepared by the authors. No details were specified except for the fact that the products were strictly anhydrous.</p> ESTIMATED ERROR: <p>Temp: precision ± 5 K. Solubility error is not specified.</p> REFERENCES:

COMPONENTS: (1) Tantalum fluoride; TaF ₅ ; [7783-71-3] (2) Propylene carbonate (4-methyl-1, 3-dioxalan-2-one); C ₄ H ₆ O ₃ ; [108-32-7]	ORIGINAL MEASUREMENTS: Fischer, H. W.; Schwabe, K. <i>Korrosion (Dresden)</i> <u>1980</u> , 11, 105-15.
VARIABLES: $T/K = 298$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p>The approximate solubility of TaF₅ at $t/^{\circ}\text{C} = 25$ is reported to be 12 g TaF₅/100 g solvent.</p> <p>The compiler calculates $m_1/\text{mol kg}^{-1} = 0.43_5$.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method. Although not stated explicitly, the solubility was apparently determined in the apparatus described for the electrolysis experiments. The apparatus was connected to a vacuum line, and extreme care was taken to avoid access of air moisture. No details were given about the time of equilibration or analysis of the saturated solutions.	SOURCE AND PURITY OF MATERIALS: (1) TaF ₅ (Ferak, West Berlin), 99% purity, was used without further purification. (2) Propylene carbonate (Ferak, West Berlin) was distilled before use. ESTIMATED ERROR: Neither temperature or solubility error were specified. REFERENCES:

<p>COMPONENTS:</p> <p>(1) Silver hexafluorotantalate(1-); AgTaF₆; [61104-79-8]</p> <p>(2) Hydrogen fluoride; HF; [7664-39-3]</p>	<p>ORIGINAL MEASUREMENTS:</p> <p>Gut, R.; Rueede, J. <i>J. Coord. Chem.</i> <u>1978</u>, <i>8</i>, 47-53.</p>
<p>VARIABLES:</p> <p style="text-align: center;">$T/K = 273$</p>	<p>PREPARED BY:</p> <p style="text-align: center;">J. Hála</p>
<p>EXPERIMENTAL VALUES:</p> <p style="text-align: center;">Both the solubility and solubility product of AgTaF₆ in liquid HF at 0°C are reported. The values are 1.23 g in 100 g HF from which the compiler calculated $m_1/\text{mol kg}^{-1} = 0.0305$, and $-\log K_{80} = 2.61$.</p>	
<p style="text-align: center;">AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Solubility was determined by isothermal method followed by chemical analysis of saturated solutions. Details were not reported. The solubility product was obtained from titrations of solutions of KTaF₆ in HF with a AgF solution in HF during which solid AgTaF₆ was formed. Details of calculations not reported. In the titrations the $[\text{Ag}^+]/[\text{TaF}_6^-]$ ratio varied 10-50-fold and the ionic strength varied within $0.15 \pm 0.03 \text{ mol dm}^{-3}$ due to changes in supporting electrolyte concentration. The titrations were carried out in a Kel-F apparatus with a burette made of a precision drilled Kel-F rod, using a Ag indicator electrode and Ag/AgBF₄(sat)/KBF₄(sat)/liquid HF or Ag/AgTaF₆(sat)/liquid HF systems as reference electrodes. The titration apparatus was handled at 0° in a refrigerator. The Ag electrode responded reversibly to the concentration of free Ag⁺ ions over the range of pAg = 1.5-20. Equilibrium potentials were reached in seconds and were constant over long periods of time.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) AgTaF₆ was prepared from AgF and TaF₅ in anhydrous HF and re-crystallized. TaF₅ used was prepared by condensing excess HF onto freshly sublimed TaCl₅, and subliming the crude TaF₅ in vacuum. AgF used was prepared by evaporation of HF from AgHF₂ which in turn was prepared in the following way. Excess HF gas was condensed on a wet filter cake of freshly precipitated Ag₂O and the solution obtained was evaporated to dryness by heating at 150° in a stream of N gas. The residue was dissolved in anhydrous HF, cooled to -78° to obtain crystals of AgF.5HF which decomposed to AgHF₂ on heating to 25°.</p> <p>(2) Anhydrous HF distilled from commercial (source not specified) 99.9% product in steel tanks was redistilled 2-3-times over AgF to remove traces of H₂S. The conductivity of the product corresponded to water content $< 10^{-4} \text{ mol dm}^{-3}$.</p>
<p>ESTIMATED ERROR:</p> <p style="text-align: center;">Precision of solubility product</p> <p style="text-align: center;">$\pm 0.04 \text{ log units.}$</p> <p>Temperature and solubility errors are not reported. The authors stated that the solubility calculated from K_{80} was somewhat higher than the isothermal value, due to the salt effect.</p>

AUXILIARY INFORMATION																																														
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solubility measurements were carried out in a Ag vessel. Mixtures were equilibrated by stirring for 7-10 hours. Four samples were taken from each saturated solution. In 2 of them the sum of free HF and Ta was titrated with alkali against methylred in the presence of CaCl_2 . It was found in independent experiments that 4.4-4.7 moles of alkali were consumed per 1 mole of Ta. In other 2 samples Ta was determined gravimetrically as Ta_2O_5 after precipitation with NH_4OH (without removal of HF), and K as K_2SO_4 in the filtrate after the determination of Ta. The content of free HF was obtained by subtraction considering the average value of 4.5 mole alkali per 1 mole Ta.	SOURCE AND PURITY OF MATERIALS: (1) KTaF_6 was prepared from Ta metal of unspecified source and purity. The metal was dissolved in HF+ HNO_3 mixture, the solution was evaporated to a small volume and by addition of 70-80% HF solution the HF concentration was adjusted to 50-60%. KTaF_6 was precipitated by addition of a solution of KHF_2 in 50-60% HF. The product was recrystallized from 50-55% HF. Analysis: found 54.31% Ta, 11.60% K; calculated 54.23% Ta, 11.69% K. (2) Concentrated HF was obtained by distillation of a mixture of equal volumes of 40% HF and concentrated H_2SO_4 . ESTIMATED ERROR: Temp: precision ± 0.1 K. Solubility error is not specified.																																													

<p>COMPONENTS:</p> <p>(1) Dipotassium heptafluoro-tantalate(2-); K_2TaF_7; [16924-00-8]</p> <p>(2) Hydrogen fluoride; HF; [7664-39-3]</p> <p>(3) Water; H_2O; [7732-18-5]</p>	<p>EVALUATOR:</p> <p>J. Hála Department of Inorganic Chemistry J. E. Purkyne University 61137 Brno, Czechoslovakia</p> <p>October, 1985</p>
<p>CRITICAL EVALUATION:</p> <p>The solubility of potassium heptafluorotantalate in aqueous hydrogen fluoride.</p> <p>Six documents (ref 1-6) report the solubility of potassium heptafluorotantalate in this system. Only the documents of Babaeva and Klyachko-Gurvich (ref 1), Savchenko and Tananaev (ref 2 and 3), and Ruff and Schiller (ref 4), which cover a wide range of HF concentration and temperature, need to be considered. The data of Marignac (ref 5) are for the solubility of K_2TaF_7 in water containing a small unspecified concentration of HF. The data of Meerson <i>et al.</i> (ref 6) were reported in graphical form only. Therefore, the data from these documents (ref 5 and 6) were not considered further.</p> <p>The data from documents (ref 1 - 3) agree qualitatively in both the trend of the solubility increasing with HF concentration and with temperature. Some discrepancies can be noted concerning the temperature dependence of the solubility (see Figure on following page). The data of Savchenko and Tananaev (ref 3) for 348 K (75 °C) are higher than those of Babaeva and Klyachko-Gurvich (ref 1) for 353 K (80 °C) at low HF concentration, but the Savchenko and Tananaev values are lower at high HF concentrations. Although less pronounced, a problem also exists between the data for 293 K (20 °C) (ref 1) and for 298 K (25 °C) (ref 2) in that the two data sets almost coincide. There are no reasons to prefer one data set over the other. All (ref 1 - 3) are classed as tentative. The data of Ruff and Schiller (ref 4) seems to be too high and can be rejected.</p> <p>REFERENCES:</p> <ol style="list-style-type: none"> Babaeva, A. V.; Klyachko-Gurvich, L. L. <i>Zh. Obshch. AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess K_2TaF_7 was equilibrated with 1 mass % HF solution in ebonite beaker. A weighed portion of the saturated solution was evaporated in a Pt dish and the residue was weighed. The results so obtained were confirmed in measurements where solutions saturated initially at higher temperatures were allowed to cool down and equilibrate at the desired temperature.	SOURCE AND PURITY OF MATERIALS: (1) K_2TaF_7 (source not specified) was repeatedly recrystallized from 1 mass % HF solution. The product contained 56.4% Ta_2O_5 (calculated 56.34% - compiler), 0.003% Fe, 0.04% Si, 0.01% Ti, and 0.02% Sn. (2) HF was purified from H_2SiF_6 , which suppressed the solubility of K_2TaF_7 , by treating the HF solution with solid K_2TaF_7 to allow for the precipitation of the Si-Ta heteropolyacid. (The authors did not mention the amount of K_2TaF_7 used for this purification process or eventual K_2TaF_7 concentration present in the purified HF.) ESTIMATED ERROR: Temp: precision ± 0.1 K. The solubility error is not specified.

^a K₂TaF₇ shaken with water; HF produced by hydrolysis of K₂TaF₇.

^b KF not used as the solute; the values correspond to K dissociated from the salt dissolved and were not considered in calculating molalities of K₂TaF₇.

^c Calculated by compiler.

^d A: K₂TaF₇, [16924-00-8]; B: solid phase of variable composition referred to as K_xTa_yO_zF_u in the original document. Its composition depended on that of the corresponding equilibrium saturated solution and approached that of the Marignac's (ref 2) insoluble salt K₄Ta₄O₅F₁₄ on repeated boiling with fresh water.

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:

Isothermal method used. Excess K₂TaF₇ was shaken with either water or a HF solution in Pt bottles for 3 hours and filtered through a Pt funnel. In one aliquot of the filtrate, Ta and free HF were determined alkalimetrically (ref 1); in another, Ta was determined gravimetrically as Ta₂O₅ after precipitation with NH₃ solution. Precipitation was repeated twice (after dissolution of hydrous Ta₂O₅ in HF) to remove adsorbed potassium, and in the collected filtrates K was determined by an unspecified method. Solid phases were identified by optical microscopy.

SOURCE AND PURITY OF MATERIALS:

- (1) K₂TaF₇ (source or method of preparation not specified) was first separated from K₂NbF₇ according to ref (2), then repeatedly recrystallized from concentrated HF solution, and finally dried at 120° to remove HF.
- (2) HF solutions were prepared from non-aqueous HF to avoid the presence of H₂SiF₆.

ESTIMATED ERROR:

Nothing specified.

^a Calculated by compiler.

^b Initial mixture contained only K_2TaF_7 and water, HF formed by hydrolysis of the salt.

^c 0.233 given in the original document which is an obvious misprint.

Note: K_2TaF_7 , [16924-00-8] was the equilibrium solid phase in all cases except for the measurements marked b) where a basic salt $K_xTa_yF_zO_n$ of unspecified composition coexisted with K_2TaF_7 .

Continued on the next page . . .

COMPONENTS: (1) Dipotassium heptafluoro-tantalate(2-); K_2TaF_7 ; [16924-00-8] (2) Hydrogen fluoride; HF; [7664-39-3] (3) Water; H_2O ; [7732-18-5]	ORIGINAL MEASUREMENTS: Babaeva, A. V.; Klyachko-Gurvich, L. L. <i>Zh. Obsh. Khim.</i> <u>1935</u> , 5, 220-3.
VARIABLES: $T/K = 273, 293, \text{ and } 353$ $HF/mass\% = 0.1-38.4 \text{ at } 273 \text{ K,}$ $0.2-38.2 \text{ at } 293 \text{ K,}$ $2.2-32.6 \text{ at } 353 \text{ K}$	PREPARED BY: J. Hála
METHOD/APPARATUS/PROCEDURE: Isothermal method used. All measurements were carried out in either Pt or bakelite test tubes immersed in a thermostat. Mixtures of K_2TaF_7 and HF solution were stirred until equilibrium was reached. At $0^\circ C$ the mixtures were stirred with a vertical stirrer and equilibrium was reached within 3-4 hours. No equilibrium times were reported for measurements at higher temperatures. The mixtures were allowed to stand for 1 hour and samples of saturated solutions were withdrawn by using either a paraffine coated glass pipette (at 0 and $20^\circ C$) or a heated rubber pipette (at $80^\circ C$). Four samples were taken from each measurements and always weighed into a Pt crucible containing water. In two samples the sum of HF and Ta was determined by titration with NaOH against phenolphthaleine. In the remaining two samples K_2TaF_7 was decomposed by heating with concentrated H_2SO_4 and then Ta was determined gravimetrically as Ta_2O_5 by precipitation with ammonia, and K gravimetrically as K_2SO_4 in the filtrate after Ta determination. Composition of the solid phases was determined by chemical analysis and microscopic observation.	
AUXILIARY INFORMATION	
SOURCE AND PURITY OF MATERIALS: (1) K_2TaF_7 was prepared from technical grade mixture of Nb+Ta oxides containing 95.4% oxides. Raw oxide mixture was purified from Fe, Mn, and Sn to obtain a product containing 47.3% Ta_2O_5 , 52.0% Nb_2O_5 , and 0.74% TiO_2 . This was dissolved in HF, and K_2TaF_7 was separated from double fluorides of Nb and Ti by repeated recrystallization from HF solutions. For some experiments K_2TaF_7 was also prepared from a technical grade product by 5-6 times recrystallizing it from HF solutions. Analysis: found 56.38% Ta_2O_5 , 19.74% K; calculated 56.41% Ta_2O_5 , 19.92% K.	SOURCE AND PURITY OF MATERIALS: ESTIMATED ERROR: REFERENCES:

^a Calculated by authors from the TaF₅ data.

^b Calculated by compiler.

Note: The decrease of the solubility of K_2TaF_7 above 45 mass% HF is caused by the conversion of K_2TaF_7 to $KTaF_6$,

The ternary K_2TaF_7 -HF- H_2O system thus turns into a quaternary one, $KTaF_6$ -HF-KF- H_2O , and the solubility data for TaF₅ correspond to the solubility of $KTaF_6$ in the presence of KHF_2 . Schreinemakers' method of wet residue did not yield an unequivocal proof for the formation of $KTaF_6$ (possibly because of incomplete conversion of K_2TaF_7) but its existence was proved by the synthesis of $KTaF_6$ by precipitation with KHF_2 of a solution of Ta metal in 50-60 mass% HF.

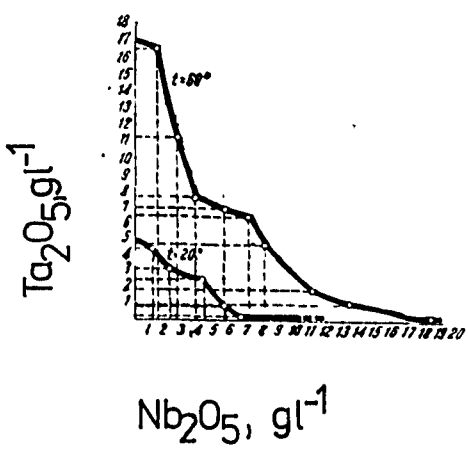

Over the concentration range of HF of 1.97 - 44.64 mass% the KF/TaF₅ mole ratio in the saturated solutions varied within the range of 1.74 - 2.31 which was taken as evidence for K_2TaF_7 [16924-00-8] being the equilibrium solid phase.

AUXILIARY INFORMATION																																																							
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Solubility measurements were carried out in a Ag vessel. Mixtures were equilibrated by stirring for 7-10 hours at $25^\circ C$ or for 4 hours at $75^\circ C$. Four samples were taken from each saturated solution. In two of them the sum of free HF and Ta was titrated with alkali against methylred in the presence of $CaCl_2$. It was found in independent experiments that 4.4-4.7 moles of alkali were consumed per 1 mole Ta. In the other 2 samples Ta was determined gravimetrically as Ta_2O_5 after precipitation with NH_4OH (without removal of HF), and K as K_2SO_4 in the filtrate after the determination of Ta. The content of free HF was obtained by subtraction considering the average value of 4.5 moles alkali per 1 mole of Ta.	SOURCE AND PURITY OF MATERIALS: (1) K_2TaF_7 (Kahlbaum), purity not specified. (2) HF used for mixtures containing up to 35 mass% HF was prepared from 40 mass% HF obtained from the acid doubly distilled from a Pt apparatus. Mixtures with higher HF content were prepared from 60-90 mass% HF obtained by distillation of a mixture of equal volumes of 40% HF and concentrated H_2SO_4 . ESTIMATED ERROR: Temp: precision ± 0.1 K. The solubility error is not specified. REFERENCES:

^a Initial concentration used in the measurement. ^b Equilibrium concentration found by analysis. ^c Formed during hydrolysis of K_2TaF_7 ; see also footnote (e) for the solid phase B. ^d Calculated by compiler. ^e A: K_2TaF_7 , [16924-00-8]; B: solid phase of variable composition referred to as $K_xTa_yO_zF_u$ in the original document. Its composition depended on that of the corresponding equilibrium saturated solution and, on repeated boiling with fresh water, approached that of the Marignac's (ref 2) insoluble salt $K_4Ta_4O_5F_{14}$. ^f In calculating molalities the experimental KF concentration values were corrected for KF dissociated from K_2TaF_7 .									
AUXILIARY INFORMATION									
METHOD/APPARATUS/PROCEDURE: Isothermal method used. Excess K_2TaF_7 was shaken with solutions of desired composition in Pt bottles for 3 hours and filtered through a Pt funnel. In one aliquot of the filtrate, Ta and free HF were determined alkalimetrically (ref 1); in another, Ta was determined gravimetrically as Ta_2O_5 after precipitation with NH_3 solution. Precipitation was repeated twice (after dissolution of hydrous Ta_2O_5 in HF) to remove adsorbed potassium, and in the collected filtrates K was determined by an unspecified method. Solid phases were identified by optical microscopy.					SOURCE AND PURITY OF MATERIALS: (1) K_2TaF_7 (source or method of preparation not specified) was first separated from K_2NbF_7 according to ref (2), then repeatedly recrystallized from concentrated HF solution, and finally dried at 120° to remove HF. (2) HF solutions were prepared from non-aqueous HF to avoid the presence of H_2SiF_6 .				
					ESTIMATED ERROR: Nothing specified.

<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Isothermal salting-out of K_2TaF_7 from its saturated solutions by solid $K_2NbOF_5 \cdot H_2O$ was used. Known amounts of the latter salt was added to saturated solutions of K_2TaF_7 at the desired temperature in the presence of 1 mass% HF in paraffine-coated beakers. The mixture was stirred for 40 minutes and then allowed to stand for 20 minutes. The K_2TaF_7 precipitated out of the solution was filtered, washed with alcohol, dried in a Pt dish, and weighed.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) K_2TaF_7 (source not specified) was repeatedly recrystallized from 1 mass% HF solution. The product contained 56.4% Ta_2O_5 (calculated 56.34% - compiler), 0.003% Fe, 0.04% Si, 0.01% Ti, and 0.02% Sn.</p> <p>(2) $K_2NbOF_5 \cdot H_2O$ (source not specified) was repeatedly recrystallized from 1 mass% HF. The product contained 51.23% Nb_2O_5 (calculated 44.28% - compiler), 0.09% Fe, 0.01% Si, 0.13% TiO_2, 0.03% Sn, and 0.1-0.2% Ta_2O_5.</p> <p>(3) HF was purified from H_2SiF_6, which suppressed the solubility of K_2TaF_7 and $K_2NbOF_5 \cdot H_2O$, by treating the HF solution with solid K_2TaF_7 and $K_2NbOF_5 \cdot H_2O$ to allow for the precipitation of Si-Ta and Si-Nb heteropolyacids. (The authors did not mention the amount of salts used in this purification process, or their eventual concentration in the purified HF solution.)</p>																		
<p>ESTIMATED ERROR:</p> <p>Temp: precision ± 0.1 K.</p> <p>The solubility error is not specified.</p> <p>$K_2NbOF_5 \cdot H_2O$; [19200-74-9]</p>																			

<p>COMPONENTS:</p> <p>(1) Rubidium heptafluorotantalate; Rb₂TaF₇; [76056-60-5]</p> <p>(2) Water; H₂O; [7732-18-5]</p>	<p>ORIGINAL MEASUREMENTS:</p> <p>Balke, C. W.</p> <p><i>J. Am. Chem. Soc.</i> <u>1905</u>, 27, 1140-57.</p>
<p>VARIABLES:</p> <p>$T/K = 298$</p>	<p>PREPARED BY:</p> <p>J. Hála</p>
<p>EXPERIMENTAL VALUES:</p> <p>The solubility of Rb₂TaF₇ in water at 25°C is reported to be approximately 1 g salt in 40 g (parts) water. From the value the compiler calculated the solubility in water to be</p> $m_1/\text{mol kg}^{-1} = 0.052.$	
<p>AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Isothermal method used. Saturated solutions of the salt were obtained by allowing the crystals to remain in contact with the solution for several hours in a rubber beaker with occasional stirring. The clear liquid was decanted into a weighed Pt dish. The solution was evaporated with few drops of HF being added when the evaporation was nearly complete. The dish with the residue was dried and weighed.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) The starting material was Ta₂O₅ which was obtained from the columbite of South Dakota. Crude K₂TaF₇ was first obtained as crystalline precipitate upon the addition of KF to the HF solution of (Ta, Nb)₂O₅ and processed to obtain pure Ta₂O₅ in the following manner. K₂TaF₇ was three times recrystallized from water containing enough HF to prevent the formation of the oxysalt. Pt and rubber ware was used. In each step large amount of salt was allowed to remain in the mother liquor to ensure a complete removal of K₂NbOF₅ and other impurities. The K₂TaF₇ so obtained was next purified from Si by evaporating the salt with excess of concentrated H₂SO₄. The residue was boiled up repeatedly with water, and Ta₂O₅ produced was repeatedly washed. Chemical tests showed absence of Fe, W, and Ti. To the solution of the oxide in diluted HF RbF was added. Rb₂TaF₇ was then recrystallized from water containing a small amount of HF to prevent the formation of the insoluble oxysalt. Analysis (mass %, found/calculated): RbF 42.90-43.26/42.91, TaF₅ 56.93-57.05/57.09.</p>

<p>VARIABLES:</p> <p>$T/K = 298$</p>	<p>PREPARED BY:</p> <p>J. Hála</p>
<p>EXPERIMENTAL VALUES:</p> <p>Two measurements of the solubility of Na_3TaF_8 in water at 25 °C were reported as 1 g of salt dissolves in 20.9 and 20.5 g (parts) of water. From the average value of 1 g salt per 20.7 g water the compiler calculated the solubility of Na_3TaF_8 in water to be $m_1/\text{mol kg}^{-1} = 0.120$.</p>	
<p>AUXILIARY INFORMATION</p>	
<p>METHOD/APPARATUS/PROCEDURE:</p> <p>Isothermal method used. Saturated solutions of the salt were obtained by allowing the crystals to remain in contact with the solution for several hours in a rubber beaker with occasional stirring. The clear liquid was decanted into a weighed Pt dish. The solution was evaporated with few drops of HF being added when the evaporation was nearly complete. The dish with the residue was dried and weighed.</p>	<p>SOURCE AND PURITY OF MATERIALS:</p> <p>(1) The starting material was Ta_2O_5 which was obtained from the columbite of South Dakota. Crude K_2TaF_7 was first obtained as crystalline precipitate upon the addition of KF to the HF solution of $(\text{Ta}, \text{Nb})_2\text{O}_5$ and processed to obtain pure Ta_2O_5 in the following manner. K_2TaF_7 was three times recrystallized from water containing enough HF to prevent the formation of the oxysalt. Pt and rubber ware was used. In each step large amount of salt was allowed to remain in the mother liquor to ensure a complete removal of K_2NbOF_5 and other impurities. The K_2TaF_7 so obtained was next purified from Si by evaporating the salt with excess of concentrated H_2SO_4. The residue was boiled up repeatedly with water, and Ta_2O_5 produced was repeatedly washed. Chemical tests showed absence of Fe, W, and Ti. The oxide was dissolved in HF and first $\text{Na}_2\text{TaF}_7 \cdot \text{H}_2\text{O}$ was obtained by concentrating and cooling a solution containing NaF and large excess TaF_5. On recrystallization of this salt from a diluted solution of HF, Na_3TaF_8 was obtained. HF used was distilled from a Pt retort with KOH added to hold back SiO_2.</p> <p>Analysis (mass %, found/calculated): NaF 31.28-31.32/31.19, TaF_5 68.45-68.9/68.81.</p>
<p>ESTIMATED ERROR:</p> <p>The temperature error is not specified.</p> <p>Soly: precision $\pm 1\%$ (compiler).</p>

AUXILIARY INFORMATION													
METHOD/APPARATUS/PROCEDURE: Isothermal method. Excess $TaCl_4$ was introduced to the solvent in a dry box. The mixture was equilibrated for 5-10 days in a thermostated vessel equipped with a hydraulic stopper to prevent both solvent evaporation and access of atmospheric moisture. Attainment of equilibrium was checked by analyzing the liquid phase for Ta in samples taken periodically over 15 days. Ta in the sample was determined gravimetrically as Ta_2O_5 either after direct ignition of the samples of the saturated solutions or after extraction of Ta into concentrated HCl and subsequent precipitation of the hydrated oxide.	SOURCE AND PURITY OF MATERIALS: (continued) chlorination with Cl gas at $250-500^\circ$; m.p. 220° . (2) Hexachloro-1,3-butadiene (source not specified) was purified to obtain a product with $d_4^{20} = 1.6807$ and $n_D^{20} = 1.5543$.												
SOURCE AND PURITY OF MATERIALS: (1) $TaCl_4$ was prepared by reduction of $TaCl_5$ with Al powder (ref 1,2). Unreacted $TaCl_5$ and $AlCl_3$ formed were removed by distillation at $210-220^\circ$. $TaCl_5$ used was prepared from 99.99% Ta metal by	ESTIMATED ERROR: Temp: precision ± 0.1 K. AUXILIARY INFORMATION																																	
METHOD/APPARATUS/PROCEDURE: Isothermal method. The Pyrex glass apparatus (ref 1) consisted of the solvent pretreatment line, the saturation, and the sampling vessels. In the pretreatment section, the solute was repeatedly pretreated by successive sublimations of the halide and condensation at -195°C of the solvent onto it. Both components were transferred into the saturation vessel which was connected to the sampling compartment through a sintered glass disc. The vessel was rocked for 24 h, the saturated solution filtered into the sampling ampoule which was then sealed off, weighed, and broken under water to hydrolyze the halide. After standing for 4-5 h, the solution was heated to 90°C, cooled and filtered, and the oxide was ignited and weighed.	SOURCE AND PURITY OF MATERIALS: (1) TaCl ₅ was prepared by passing dry HCl gas over Ta metal sheet at 350-400°C. The product was purified by 5 or 6 fractional sublimations <i>in vacuo</i> , and finally sublimed into fragile hook-ended ampoule. (2) Diethylether (anaesthetic) was distilled from 1/5 of its volume of H ₂ SO ₄ , kept over P ₂ O ₅ for at least a week, decanted, fractionated under dry N gas, and stored over Na wire. ESTIMATED ERROR: Temp: precision ± >0.1 K. Solubility error is not specified. REFERENCES: 1. Fairbrother, F.; Scott, N.; Prophet, H. <i>J. Chem. Soc.</i> , London <u>1956</u> , 1164.																																

COMPONENTS: (1) Tantalum chloride; $TaCl_5$; [7721-01-9] (2) Propylene carbonate (4-methyl-1,3-dioxalan-2-one); $C_4H_6O_3$; [108-32-7]	ORIGINAL MEASUREMENTS: Fischer, H. W.; Schwabe, K. <i>Korrosion (Dresden)</i> <u>1980</u> , 11, 105-15.
VARIABLES: $T/K = 298$	PREPARED BY: J. Hála
EXPERIMENTAL VALUES: <p style="text-align: center;">The approximate solubility of $TaCl_5$ at $t/^\circ C = 25$ is reported to be 26 g $TaCl_5$/100 g solvent. The compiler calculates $m_1/mol\ kg^{-1} = 0.73$.</p>	
AUXILIARY INFORMATION	
METHOD/APPARATUS/PROCEDURE: Isothermal method. Although not stated explicitly, the solubility was apparently determined in the apparatus described for electrolysis experiments. The apparatus was connected to a vacuum line, and extreme care was taken to avoid access of air moisture. No details were given about the time of equilibration or the analysis of the saturated solutions.	SOURCE AND PURITY OF MATERIALS: (1) $TaCl_5$ (Merck) contained $\leq 0.003\%$ Nb and $\leq 0.015\%$ of other metals, and was used without further purification. (2) Propylene carbonate (Ferak, West Berlin) was purified by distillation. ESTIMATED ERROR: Neither temperature or solubility error were specified. REFERENCES:

AUXILIARY INFORMATION																										
METHOD/APPARATUS/PROCEDURE: Isothermal method was used. Freshly distilled TaCl ₅ was used for all measurements. The vessel with collected TaCl ₅ was briefly disconnected from the chlorination app., stoppered, and placed in a thermostat. A portion of the dry solvent was added and the mixture was stirred for 10-14 hours at the desired temperature. The stirrer was equipped with a Hg seal. After equilibration the mixture was allowed to stand for several hours, and a 10 ml sample was withdrawn with a pipette with a cotton filter. On evaporating the solvent TaCl ₅ hydrolyzed, and Ta content in the sample was determined gravimetrically as Ta ₂ O ₅ .	SOURCE AND PURITY OF MATERIALS: (1) TaCl ₅ was prepared by chlorination with Cl gas in the presence of charcoal at 600-700° of Ta ₂ O ₅ . The product was twice distilled and collected in the vessel for solubility measurement; m.p. 211.3°. Analysis: found 48.67% Cl, 51.25% Ta; calculated 49.5% Cl, 50.5% Ta. The Ta ₂ O ₅ used was separated from Nb ₂ O ₅ in the mixture of Nb and Ta oxides (obtained from ilmenorutile) according to Marignac (ref 1) and Memberg and Winzer (ref 2). (2) CCl ₄ was purified and dried by standard methods.

METHOD/APPARATUS/PROCEDURE: Isothermal method. Excess $TaCl_5$ was introduced to the solvent in a dry box. The mixture was equilibrated for 5-10 days in a thermostated vessel equipped with a hydraulic stopper to prevent both solvent evaporation and access of atmospheric moisture. Attainment of equilibrium was checked by analyzing the liquid phase for Ta in samples taken periodically over 15 days. Ta in the sample was determined gravimetrically as Ta_2O_5 either after direct ignition of the samples of the saturated solutions or after extraction of Ta into concentrated HCl and subsequent precipitation of the hydrated oxide.	SOURCE AND PURITY OF MATERIALS:(continued) (2) Hexachloro-1,3-butadiene (source not specified) was purified to obtain a product with $d_4^{20} = 1.6807$ and $n_D^{20} = 1.5543$. ESTIMATED ERROR: Temp: precision ± 0.1 K. Soly: precision $\pm 0.2-0.5$ %.												
SOURCE AND PURITY OF MATERIALS: (1) $TaCl_5$ was prepared from 99.99% purity Ta metal by chlorination with Cl gas at $250-500^\circ$. The product m. at 220° and was stored in a dry box.	REFERENCES:

CRITICAL EVALUATION:

An evaluation of the solubility of TaCl₅ in TiCl₄ between 273 and 403 K.

Six sets of data are available for the temperature dependence of the solubility of TaCl₅ in TiCl₄ (ref 1-6). In all of the papers the solubilities were determined by an isothermal method and by analysis of the saturated solutions. In two papers (ref 2, 3) a polythermal method was also used in the region of higher solubilities. The solubility values obtained by the isothermal method are compared in Figure 1. Of these, the data of Tarasenkov and Komandin are much higher than the data of the other authors. The authors (ref 1) themselves state the low precision of their data, and these data can be rejected. [The poor quality of their data can be seen in their NbCl₅/TaCl₅ solubility ratio in TiCl₄ which indicates a much larger difference in solubility than expected from the properties of Nb and Ta.]

The remaining five data sets show good agreement, especially those of (ref 4-6). The measurements in these three documents do not extend below 25 °C, and they cannot be compared with the data of (ref 2 and 3) which appear to be slightly lower at the higher temperatures. Because of the different temperature ranges studied in these papers it is not possible to give a preference to any of these data. All of the data from (ref 2-6) were treated by a linear regression to obtain the equation

$$\log (m_1/\text{mol kg}^{-1}) = -1.919 + 0.014285 (t/^\circ\text{C})$$

for the 0 to 130 °C temperature interval.

The two data sets obtained by the polythermal method (ref 2 and 3) differ considerably. The values of Niselson and Perekhrest (ref 3) are lower than those of Morozov and Toptygin (ref 2) at a given temperature by 5-10 mass% TaCl₅. The reason may be the strong tendency to form super saturated solutions in the system (ref 3) which makes it difficult to determine the liquidus temperature from cooling curves. The Niselson and Perekhrest polythermal values agree well with the isothermal values of other authors (black triangles in Fig 1), and their data should be given preference.

AUXILIARY INFORMATION																									
METHOD/APPARATUS/PROCEDURE: Both isothermal and polythermal methods were used. In the isothermal method TiCl ₄ was distilled onto excess TaCl ₅ and the mixture was equilibrated in a tube closed with Hg seal and equipped with a stirrer. TaCl ₅ content in the saturated solution was determined from the total Cl ⁻ content as determined by Volhard's method after hydrolysis of the sample and removal of the hydrolytic products. In the polythermal method known amounts of both chlorides were slowly heated in a closed vessel and the temperature of the disappearance of the last crystals was read. The system was then cooled slowly and the temperature of crystallization was read. The procedure was repeated several times and the average temperature was taken. It is not clear from the document which of the methods was used to obtain the data reported.	SOURCE AND PURITY OF MATERIALS: (1) TaCl ₅ was prepared by chlorination of Ta metal. The product was stored in sealed ampoules. (2) TiCl ₄ , tech. grade, was purified by fractional distillation after preliminary treatment with Hg metal. The product boiled at 136°/743 mmHg. ESTIMATED ERROR: Temp: precision ± 0.1 K for the isothermal method. The authors state low precision of the data and suggest the data be taken as qualitative.

AUXILIARY INFORMATION																																																																																																	
METHOD/APPARATUS/PROCEDURE: In the isothermal method mixtures of TiCl ₄ and TaCl ₅ were distilled into a test-tube with a side arm. The test-tube was sealed off, kept at the desired temperature for 20-40 h, and a part of the saturated solution was poured into the side arm. The latter was then sealed off, cooled, and weighed. Prior to analysis, most of the TiCl ₄ was removed by distillation in the presence of NaCl. The final separation of Ta from the remaining Ti was achieved by means of phenylarsonic acid. In the polythermal method, mixtures of TiCl ₄ and TaCl ₅ were prepared by weighing, melted, and cooling curves were recorded. NOTE: The two data sets do not coincide because the systems tend to form supersaturated solutions.	SOURCE AND PURITY OF MATERIALS: (1) TaCl ₅ was prepared by chlorination of Ta metal with Cl ₂ gas. (2) Commercially available TiCl ₄ (source not specified) was distilled twice. The fraction boiling at 136°C at 760 mmHg was used. ESTIMATED ERROR: REFERENCES:

AUXILIARY INFORMATION
METHOD/APPARATUS/PROCEDURE:

At higher TaCl₅ concentrations (>4.13 mass%) the liquidus curve was obtained by visual polythermal method. TaCl₅ and TiCl₄ were weighed into a glass tube previously dried *in vacuo* at 350-400°. The tube was sealed, heated in a furnace to melt the mixture, and then allowed to cool slowly in a thermostated glycerine bath under constant rotation at 60 rpm. The liquidus temperature was taken as the average of temperatures of appearance and disappearance of crystals in the melt recorded at successive cooling and heating of the system. At lower TaCl₅ concentrations, isothermal method was used. Ampoules containing TaCl₅ and TiCl₄ were equilibrated for 30 h at 40 and 60°, and for 60 h at 0 and 17.5°. A sample of the saturated solution was hydrolyzed, the precipitate ignited to oxides, and the Ta concentration was determined spectrographically.

SOURCE AND PURITY OF MATERIALS:

Source of TaCl₅ and TiCl₄ not specified. Both halides were purified by rectification and stored in sealed ampoules.

AUXILIARY INFORMATION																									
METHOD/APPARATUS/PROCEDURE: Isothermal method used. An all-glass apparatus was used in which the unit for distilling the solvent, equipment for solubility determination, and sampling and hydrolyzing the saturated solutions were coupled together. Transfer of liquids in the system was carried out by means of nitrogen gas pressure. Samples for analysis were taken from the dissolution vessel through an immersed tube thermostated to a temperature higher by 2° than that of the dissolution vessel. The samples were hydrolyzed in diluted acid and Ta was separated from Ti by repeated precipitation with N-benzoyl-N-phenylhydroxylamine (ref 1.).	SOURCE AND PURITY OF MATERIALS: (1) TaCl ₅ prepared according to ref (2). Its purity was not specified. (2) TiCl ₄ , tech. grade, was purified by refluxing it with 1.5 g CuSO ₄ ·5H ₂ O and 10 g charcoal per 300 ml TiCl ₄ for 2 h. A colorless product was obtained, b. 136°, electric conductivity < 10 ⁻⁹ cm ⁻¹ . ESTIMATED ERROR: Temp: precision ± 0.2 K Solubility error not specified. REFERENCES: 1. Moshier, R. W.; Schwarberg, J. AUXILIARY INFORMATION																					
METHOD/APPARATUS/PROCEDURE: The saturated solutions were prepared in a sealed, nitrogen-filled apparatus (ref 1), for 21-90 hours. After equilibration a sample of the filtered solution was collected in a detachable ampoule. Dissolving and sampling were carried out in a thermostated waterbath. Each ampoule with the sample was broken under 3 mol dm ⁻³ HNO ₃ in a sealed bottle, and hydrous oxides of Ta and Ti were precipitated by ammonia. After filtration and ignition at 800° the mixed oxides were analyzed by x-ray spectrography.	SOURCE AND PURITY OF MATERIALS: (1) TaCl ₅ (Alfa Inorganics), lab. grade, was used as obtained. (2) TiCl ₄ was purified by treatment with Cu powder and distillation. It was stored in sealed ampoules. ESTIMATED ERROR: Temp: precision ± 0.5 K Soly: precision ± 2 % REFERENCES: 1. Long, A. ^a Determined for various equilibration times (see the procedure).

^b Average.

^c Calculated by compiler.

Note: By least squares treatment of the data the authors obtained the following equation for the solubility of TaCl₅ in TiCl₄ (solubility *S* expressed in mole fractions):

$$\log S = -1689/T + 3.336$$

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:

Isothermal method. A thermostated glass vessel equipped with a stirrer, thermometer and a glass pipette for withdrawing the samples, and sealed with silicone oil, was used. The system was mixed for 1 h at a desired temperature and then allowed to stand at this temperature for a prolonged period of time during which samples were taken at 3 h intervals. Ta was determined gravimetrically as the oxide by precipitation with ammonia after separation of Ti and Ta hydrated oxides in HCl medium.

SOURCE AND PURITY OF MATERIALS:

- (1) TaCl₅ of unspecified origin contained (in mass %) 0.01 Mn, 0.01 Si, 0.15 Ni, 0.01 Fe, 0.01 Cu, and 0.03 Nb.
- (2) TiCl₄ (source not specified) was purified by using Cu filings. It contained (in mass %) 0.005 Mn, Si, and Mg, and 0.01 Fe.

ESTIMATED ERROR:

Temp: precision ± 0.2 K.
Solubility error not specified.

AUXILIARY INFORMATION																									
METHOD/APPARATUS/PROCEDURE: Isothermal method. The Pyrex glass apparatus (ref 1) consisted of the solvent pretreatment line, the saturation, and the sampling vessels. In the pretreatment section, the solute was repeatedly pretreated by successive sublimations of the halide and condensation at -195°C of the solvent onto it. Both components were transferred into the saturation vessel which was connected to the sampling compartment through a sintered glass disc. The vessel was rocked for 24 h, the saturated solution filtered into the sampling ampoule which was then sealed off, weighed, and broken under water to hydrolyze the halide. After standing for 4-5 h, the solution was heated to 90°C, cooled and filtered, and the oxide was ignited and weighed.	SOURCE AND PURITY OF MATERIALS: (1) TaBr ₅ free from hydrolytic products was prepared by reacting dry Br with Ta metal sheet in a closed system at 400-450°C. The product was purified by 5 or 6 fractional sublimations <i>in vacuo</i> , and finally sublimed into fragile hook-ended ampoule. (2) Diethylether (anesthetic) was distilled from 1/5 of its volume of H ₂ SO ₄ , kept over P ₂ O ₅ for at least a week, decanted, fractionated under dry N gas, and stored over Na wire.																								
ESTIMATED ERROR: Temp: precision ± >0.1 K. Solubility error is not specified.	REFERENCES: 1. Fairbrother, F.; Scott, N.; Prophet, H. <i>J. Chem. Soc. London</i> <u>1956</u> , 1164.

AUXILIARY INFORMATION																									
METHOD/APPARATUS/PROCEDURE: Isothermal method was used. Freshly distilled TaBr ₅ was used for all measurements. The vessel with collected TaBr ₅ was briefly disconnected from the bromination app.; stoppered, and placed in a thermostat. A portion of the dry solvent was added and the mixture was stirred for 10-14 hours at the desired temperature. The stirrer was equipped with a Hg seal. After equilibration the mixture was allowed to stand for several hours, and a 10 ml sample was withdrawn with a pipette with a cotton filter. On evaporating the solvent TaBr ₅ hydrolyzed, and Ta content in the sample was determined gravimetrically as Ta ₂ O ₅ .	SOURCE AND PURITY OF MATERIALS: (1) TaBr ₅ was prepared by bromination of a mixture of Ta ₂ O ₅ with charcoal by Br gas at 600-700° using CO ₂ as a carrier gas for bromine. The product was twice distilled and collected in the vessel used for solubility measurements. Analysis: found 67.7-67.8% Br, 32.2-32.5% Ta; calculated 68.9% Br, 31.1% Ta. The Ta ₂ O ₅ used was separated from Nb ₂ O ₅ in the mixture of Nb and Ta oxides (obtained from ilmenorutile) according to Marignac (ref 1) and Memberg and Winzer (ref 2). (2) CCl ₄ was purified and dried by standard methods. REFERENCES: 1. Marignac, M. C. <i>Ann. Chim. Phys.</i> <u>1865</u> , <i>8</i> , 49. 2. Memberg, E.; Winzer, K. <i>Z. Angew. In this index diammonium and dipotassium halates are indexed under ammonium and potassium.

Acetic acid (aq)	+ cesium fluoride	158
	+ hafnium(IV) fluoride	155, 158
	+ potassium fluoride	155
Acetic acid, chloro-	+ niobium(V) chloride	252
	+ zirconium(IV) chloride	107
Acetonitrile	+ bis(3-methylbutyl)ether	108, 109,
		176, 177
	+ hafnium(IV) chloride	176, 177
	+ zirconium(IV) chloride	108, 109
Ammonia	+ ammonium chloride	34
	+ sodium amalgam	26, 27
	+ sodium bromide	26, 27, 31, 32,
		36, 37
	+ sodium chloride	35
	+ titanium(II) chloride	26, 27
	+ titanium(III) chloride	31, 32
	+ titanium(IV) chloride	34-37
Ammonium chloride	+ ammonia	34
	+ titanium(IV) chloride	34
Ammonium chloride (aq)	+ ammonium hexachlorotitanate	47
	+ hafnium dichloride oxide	190
	+ hydrogen chloride	47
	+ titanium(III) chloride	30
	+ zirconium dichloride oxide	120
Ammonium fluoride (aq)	+ ammonium heptafluorohafnate	175
	+ triammonium heptafluorozirconate	E102, 103, 104
Ammonium heptafluorohafnate	+ water	174, 175
Ammonium heptafluorohafnate (aq)	+ ammonium fluoride	175
Ammonium hexachlorohafnate(IV) (aq)	+ hydrogen chloride	209
Ammonium hexachlorotitanate (aq)	+ ammonium chloride	47
	+ hydrogen chloride	46, 47
Ammonium hexachlorozirconate(IV) (aq)	+ hydrogen chloride	142
Ammonium hexafluorohafnate	+ water	162
Ammonium hexafluorotitanate	+ ethanol	7
	+ water	4
Ammonium hexafluorotitanate (aq)	+ hydrogen fluoride	5, 6
	+ diammonium pentafluorooxonioate	5, 6
Ammonium hexafluorozirconate(IV)	+ water	81, 82
Ammonium hexafluorozirconate(IV) (aq)	+ hydrogen fluoride	82
Ammonium pentachlorotitanate (aq)	+ hydrogen chloride	42
Ammonium pentafluorooxonioate (aq)	+ ammonium hexafluorotitanate	5, 6
	+ hydrogen fluoride	5, 6
Ammonium pentafluorozirconate(aq)	+ hydrogen fluoride	74
Barium chloride (aq)	+ hafnium dichloride oxide	197
	+ zirconium dichloride oxide	134
Benzene	+ niobium(V) chloride	248
	+ tantalum(V) chloride	288
	+ titanium(IV) chloride	58
Benzene, bromo-	+ tantalum(V) bromide	310
Benzene, 1,3-dimethyl-	+ tantalum(V) chloride	290
Benzene, methyl-	+ tantalum(V) chloride	289
Benzene, 1,3,5-trimethyl-	+ tantalum(V) chloride	291
Bromine trifluoride	+ niobium(V) fluoride	228

Butane, 1,1'-oxybis[3-methyl-		
	+ acetonitrile	108, 109, 176, 177
	+ hafnium(IV) chloride	176, 177
	+ zirconium(IV) chloride	108, 109
Cadmium chloride (aq)	+ zirconium dichloride oxide	123
Calcium chloride (aq)	+ hafnium dichloride oxide	192-195
	+ hydrogen chloride	128-130, 193-195
	+ zirconium dichloride oxide	126-130
Carbon disulfide	+ tantalum(V) chloride	297
Cesium chloride (aq)	+ hafnium dichloride oxide	202, 203
	+ zirconium dichloride oxide	139
Cesium fluoride	+ acetic acid	158
	+ hafnium(IV) fluoride	158
Cesium fluoride(aq)	+ hafnium(IV) fluoride	157
	+ zirconium(IV) fluoride	73
Cesium hexachlorohafnate(IV) (aq)	+ hydrogen chloride	212
Cesium hexachlorotitanate (aq)	+ hydrogen chloride	50
Cesium hexachlorozirconate(IV) (aq)	+ hydrogen chloride	145
Cesium hexafluorohafnate	+ water	E171, 172, 173
Cesium hexafluorotitanate	+ ethanol	25
	+ water	23, 24
Cesium hexafluorozirconate(IV)	+ water	97, 98
Cesium pentachlorotitanate (aq)	+ hydrogen chloride	45
Cesium pentafluorohafnate	+ water	161
Cesium pentafluorozirconate(IV)	+ water	80
Copper(II) chloride (aq)	+ zirconium dichloride oxide	124
Cyclohexane	+ tantalum(V) chloride	287
1,3-Dioxalan-2-one, 4-methyl-		
	+ niobium(V) chloride	250
	+ tantalum(V) chloride	293
	+ tantalum(V) fluoride	269
Ethane, 1,2-dichloro-	+ hafnium(IV) bromide	215
	+ titanium(IV) bromide	55
	+ zirconium(IV) bromide	147
Ethane, 1,1'-oxybis-	+ niobium(V) bromide	264
	+ niobium(V) chloride	249
	+ tantalum(V) bromide	308
	+ tantalum(V) chloride	292
	+ tantalum(V) iodide	311

	+ nitric acid	236
	+ potassium fluoride	243, 281, 282

Hydrogen fluoride (aq)	+ potassium heptafluoroniobate	239-241, 243
	+ potassium heptafluorotantalate	E272, E273, 274-283
	+ potassium hexafluorohafnate	167
	+ potassium hexafluoroniobate	238
	+ potassium hexafluorotantalate	271
	+ potassium hexafluorozirconate(IV)	93, 94
	+ potassium pentafluorooxoniobate	283
	+ potassium pentafluorozirconate(IV)	78
	+ tantalum(V) fluoride	266, 267
	+ vanadium fluoride oxide	221
	+ vanadium oxide fluoride	219, 220
+ zirconium(IV) fluoride	E61, 62-66	
Lithium chloride	+ sulfinylbismethane	223, 224
	+ vanadium(II) chloride	223
	+ vanadium(III) chloride	224
Lithium chloride (aq)	+ hafnium dichloride oxide	198
	+ zirconium dichloride oxide	135
Lithium hexafluorotitanate	+ ethanol	10
	+ water	8, 9
Magnesium chloride (aq)	+ hafnium dichloride oxide	191
	+ zirconium dichloride oxide	125
Methane, sulfinylbis-	+ lithium chloride	223, 224
	+ vanadium(II) chloride	223
	+ vanadium(III) chloride	224
Methane, tetrachloride	+ hafnium(IV) bromide	214
	+ tantalum(V) bromide	309
	+ tantalum(V) chloride	294, 295
	+ titanium(IV) bromide	54
Methane, trichloro-	+ hafnium(IV) bromide	213
	+ titanium(IV) bromide	55
	+ zirconium(IV) bromide	146
Methanol	+ hafnium dichloride oxide	204
Niobium(V) bromide	+ 1,1'-oxybisethane	264
Niobium(IV) chloride	+ 1,1,2,3,4,4-hexachlorobutadiene	247
Niobium(V) chloride	+ benzene	248
	+ chloroacetic acid	252
	+ 1,1,2,3,4,4-hexachlorobutadiene	251
	+ 4-methyl-1,3-dioxalan-2-one	250
	+ niobium chloride oxide	E260, 261, 262
	+ 1,1'-oxybisethane	249
	+ titanium(IV) chloride	E253, E254, 255-259
	+ niobium(V) chloride	E260, 261, 262
	+ titanium chloride	263
	+ bromine trifluoride	228
+ uranium hexafluoride	229	
Niobium fluoride (aq)	+ hydrogen fluoride	226, 227
Niobium fluoride oxide (aq)	+ hydrogen fluoride	E230, E231, 232-236
	+ nitric acid	236
	+ zirconium(IV) fluoride	68, 69
Nitric acid	+ hydrogen chloride	140, 141
	+ hydrogen fluoride	236
	+ niobium fluoride oxide	236
	+ zirconium dichloride oxide	140, 141
	+ zirconium dinitrate oxide	140, 141
	+ triammonium heptafluorozirconate	105
Nitric acid, ammonium salt (aq)		
Nitric acid, calcium salt	+ potassium hexafluorotitanate	18
	+ potassium hexafluorotitanate	19
Nitric acid, strontium salt		
Nitrogen oxide	+ hydrogen fluoride	67
	+ zirconium(IV) fluoride	67
1-Octanol	+ hafnium dichloride oxide	208
sec-Octanol	+ hafnium dichloride oxide	208

Potassium chloride (aq)	+ hafnium dichloride oxide	200
	+ zirconium dichloride oxide	137
Potassium fluoride	+ acetic acid	155
	+ hafnium(IV) fluoride	155
Potassium fluoride (aq)	+ hafnium(IV) fluoride	154
	+ hydrogen fluoride	243, 281, 282
	+ potassium heptafluoroniobate	242, 243
	+ potassium heptafluorotantalate	281, 282
	+ titanium(IV) fluoride	2
	+ zirconium(IV) fluoride	71
Potassium heptafluoroniobate (aq)		
	+ hydrogen fluoride	239-241, 243
	+ potassium fluoride	242, 243
Potassium heptafluorotantalate (aq)		
	+ hydrogen fluoride	E272, E273, 274-283
	+ potassium fluoride	281, 282
	+ potassium pentafluorooxoniobate	283
Potassium hexachlorohafnate(IV) (aq)		
	+ hydrogen chloride	210
Potassium hexachloroniobate		
	+ 1,1,2,3,4,4-hexachloro-1,3-butadiene	246
Potassium hexachlorotantalate		
	+ 1,1,2,3,4,4-hexachloro-1,3-butadiene	307
Potassium hexachlorotitanate (aq)		
	+ hydrogen chloride	48
Potassium hexachlorozirconate(IV) (aq)		
	+ hydrogen chloride	143
Potassium hexafluorohafnate		
	+ water	E163, 164-167
Potassium hexafluorohafnate (aq)		
	+ hydrogen fluoride	167
Potassium hexafluoroniobate (aq)		
	+ hydrogen fluoride	238
Potassium hexafluorotantalate (aq)		
	+ hydrogen fluoride	271
Potassium hexafluorotitanate		
	+ ethanol	20
	+ water	E13, 14-19
Potassium hexafluorotitanate (aq)		
	+ nitric acid, calcium salt	18
	+ nitric acid, strontium salt	19
Potassium hexafluorozirconate(IV)		
	+ water	E84, E85, 86-94
Potassium hexafluorozirconate(IV) (aq)		
	+ hydrogen fluoride	93, 94
Potassium pentachlorotitanate (aq)		
	+ hydrogen chloride	43
Potassium pentafluorohafnate		
	+ water	159
Potassium pentafluorooxoniobate		
	+ water	244
Potassium pentafluorooxoniobate (aq)		
	+ hydrogen fluoride	283
	+ potassium heptafluorotantalate	283
Potassium pentafluorozirconate(IV)		
	+ water	76-78
Potassium pentafluorozirconate(IV) (aq)		
	+ hydrogen fluoride	78
Rubidium chloride (aq)	+ hafnium dichloride oxide	201
	+ zirconium dichloride oxide	138
Rubidium fluoride (aq)	+ hafnium(IV) fluoride	156
	+ zirconium fluoride	72
Rubidium heptafluorotantalate		
	+ water	284
Rubidium hexachlorohafnate(IV) (aq)		
	+ hydrogen chloride	211
Rubidium hexachlorotitanate (aq)		
	+ hydrogen chloride	49
Rubidium hexachlorozirconate(IV) (aq)		
	+ hydrogen chloride	144
Rubidium hexafluorohafnate		
	+ water	E168, 169, 170

Rubidium hexafluorotitanate		
	+ water	21, 22
Rubidium hexafluorozirconate(IV)		
	+ water	95, 96
Rubidium pentachlorotitanate (aq)		
	+ hydrogen chloride	44
Rubidium pentafluorohafnate		
	+ water	160
Rubidium pentafluorozirconate(IV)		
	+ water	79
Silver hexafluoroniobate	+ hydrogen fluoride	237
Silver hexafluorotantalate		
	+ hydrogen fluoride	270
Sodium amalgam	+ ammonia	26, 27
	+ sodium bromide	26, 27
	+ titanium(II) chloride	26, 27
Sodium bromide	+ ammonia	26, 27, 31, 32,
		36, 37
	+ sodium amalgam	26, 27
	+ titanium(II) chloride	26, 27
	+ titanium(III) chloride	31, 32
	+ titanium(IV) chloride	36, 37
Sodium chloride	+ ammonia	35
	+ titanium(IV) chloride	35
Sodium chloride (aq)	+ hafnium dichloride oxide	199
	+ zirconium dichloride oxide	136
Sodium fluoride (aq)	+ zirconium(IV) fluoride	70
Sodium hexachloroniobate	+ 1,1,2,3,4,4-hexachloro-1,3-butadiene	245
Sodium hexachlorotantalate		
	+ 1,1,2,3,4,4-hexachloro-1,3-butadiene	306
Sodium hexafluorotitanate		
	+ ethanol	12
	+ water	11
Sodium hexafluorozirconate(IV)		
	+ water	83
Sodium pentafluorozirconate(IV)		
	+ water	75
Strontium chloride (aq)		
	+ hafnium dichloride oxide	196
	+ zirconium dichloride oxide	131-133
Sulfur dioxide	+ titanium(IV) bromide	56, 57
	+ titanium(IV) chloride	38, 39
	+ zirconium(IV) chloride	110
Tantalum(V) bromide	+ 1,1'-oxybisethane	308
	+ bromoethane	310
	+ tetrachloromethane	309
Tantalum(IV) chloride	+ 1,1,2,3,4,4-hexachloro-1,3-butadiene	286
Tantalum(V) chloride	+ benzene	288
	+ carbon disulfide	297
	+ cyclohexane	287
	+ 1,3-dimethylbenzene	290
	+ 1,1,2,3,4,4-hexachloro-1,3-butadiene	296
	+ 1,1'-oxybisethane	292
	+ methylbenzene	289
	+ 4-methyl-1,3-dioxalan-2-one	293
	+ tetrachloromethane	294, 295
	+ titanium chloride	E298, E299, 300-305
	+ 1,3,5-trimethylbenzene	291
Tantalum(V) fluoride	+ 4-methyl-1,3-dioxalan-2-one	269
	+ uranium hexafluoride	268
Tantalum(V) fluoride (aq)	+ hydrogen fluoride	266, 267
Tantalum(V) iodide	+ 1,1'-oxybisethane	311
Titanium(IV) bromide	+ 1,2-dichloroethane	55
	+ ethanol	51
	+ 1,1'-oxybisethane	52
	+ sulfur dioxide	56, 57
	+ tetrachloromethane	54
	+ trichloromethane	53
Titanium(II) chloride	+ ammonia	26, 27
	+ sodium amalgam	26, 27
	+ sodium bromide	26, 27
Titanium(III) chloride	+ ammonia	31, 32
	+ sodium bromide	31, 32

Titanium(IV) chloride	+ ammonia	34-37
	+ ammonium chloride	34
	+ niobium chloride	E253, E254, 255-259
	+ niobium chloride oxide	263
	+ sodium bromide	36, 37
	+ sodium chloride	35
	+ sulfur dioxide	38, 39
	+ tantalum(V) chloride	E298, E299, 300-305
	+ titanium dichloride oxide	40, 41
Titanium(III) chloride (aq)	+ ammonium chloride	30
	+ hydrochloric acid	28, 29
Titanium(IV) chloride (aq)	+ hydrochloric acid	33
Titanium(IV) fluoride	+ uranium hexafluoride	3
Titanium(IV) fluoride (aq)	+ potassium fluoride	2
Titanium(IV) iodide	+ benzene	58
Titanium dichloride oxide	+ titanium(IV) chloride	40, 41
Triammonium heptafluorozirconate	+ water	E99, 100, 101
Triammonium heptafluorozirconate (aq)	+ ammonium fluoride	E102, 103, 104
	+ nitric acid, ammonium salt	105
Trimethylammonium chloride (aq)	+ zirconium dichloride oxide	121
Tripotassium heptafluorozirconate	+ water	106
Trisodium octafluorotantalate	+ water	285
Uranium hexafluoride	+ niobium(V) fluoride	229
	+ tantalum fluoride	268
	+ titanium fluoride	3
	+ vanadium fluoride	218
	+ vanadium fluoride oxide	222
Vanadium(II) chloride	+ lithium chloride	223
	+ sulfinylbismethane	223
Vanadium(III) chloride	+ lithium chloride	224
	+ sulfinylbismethane	224
Vanadium(V) fluoride	+ uranium hexafluoride	218
Vanadium fluoride oxide	+ uranium hexafluoride	222
Vanadium oxide fluoride (aq)	+ hydrogen fluoride	219, 220
Vanadium fluoride oxide (aq)	+ hydrogen fluoride	221
Zinc chloride (aq)	+ zirconium dichloride oxide	122
Zirconium bromide	+ 1,2-dichloroethane	147
	+ trichloromethane	146
Zirconium(IV) chloride	+ acetonitrile	108, 109
	+ chloroacetic acid	107
	+ 1,1'-oxybis(3-methylbutane)	108, 109
	+ sulfur dioxide	110
Zirconium dibromide oxide (aq)	+ hydrogen bromide	148
Zirconium dichloride oxide	+ water	111
Zirconium dichloride oxide (aq)	+ ammonium chloride	120
	+ barium chloride	134
	+ cadmium chloride	123
	+ calcium chloride	126-130
	+ cesium chloride	139
	+ copper(II) chloride	124
	+ hydrogen chloride	E112, E113, 114-119, 128-130, 132, 133, 140
	+ lithium chloride	141
	+ magnesium chloride	135
	+ nitric acid	125
	+ potassium chloride	140, 141
		137

Zirconium dichloride oxide (aq)	
+ rubidium chloride	138
+ sodium chloride	136
+ strontium chloride	131-133
+ trimethylammonium chloride	121
+ zinc chloride	122
+ zirconium dinitrate oxide	140, 141
Zirconium dinitrate oxide (aq) + hydrogen chloride	140, 141
+ nitric acid	140, 141
+ zirconium dichloride oxide	140, 141
Zirconium(IV) fluoride	
+ hydrogen fluoride	60, 67
+ nitrogen oxide	67
Zirconium(IV) fluoride (aq)	
+ cesium fluoride	73
+ hydrogen fluoride	E61, 62-66
+ nitric acid	68, 69
+ potassium fluoride	71
+ rubidium fluoride	72
+ sodium fluoride	70

SOLUBILITY DATA SERIES

Volume 1	H. L. Clever, <i>Helium and Neon</i>
Volume 2	H. L. Clever, <i>Krypton, Xenon and Radon</i>
Volume 3	M. Salomon, <i>Silver Azide, Cyanide, Cyanamides, Cyanate, Selenocyanate and Thiocyanate</i>
Volume 4	H. L. Clever, <i>Argon</i>
Volume 5/6	C. L. Young, <i>Hydrogen and Deuterium</i>
Volume 7	R. Battino, <i>Oxygen and Ozone</i>
Volume 8	C. L. Young, <i>Oxides of Nitrogen</i>
Volume 9	W. Hayduk, <i>Ethane</i>
Volume 10	R. Battino, <i>Nitrogen and Air</i>
Volume 11	B. Scrosati and C. A. Vincent, <i>Alkali Metal, Alkaline Earth Metal and Ammonium Halides. Amide Solvents</i>
Volume 12	C. L. Young, <i>Sulfur Dioxide, Chlorine, Fluorine and Chlorine Oxides</i>
Volume 13	S. Siekierski, T. Mioduski and M. Salomon, <i>Scandium, Yttrium, Lanthanum and Lanthanide Nitrates</i>
Volume 14	H. Miyamoto, M. Salomon and H. L. Clever, <i>Alkaline Earth Metal Halates</i>
Volume 15	A. F. M. Barton, <i>Alcohols with Water</i>
Volume 16/17	E. Tomlinson and A. Regosz, <i>Antibiotics: I. β-Lactam Antibiotics</i>
Volume 18	O. Popovych, <i>Tetraphenylborates</i>
Volume 19	C. L. Young, <i>Cumulative Index: Volumes 1–18</i>
Volume 20	A. L. Horvath and F. W. Getzen, <i>Halogenated Benzenes, Toluenes and Phenols with Water</i>
Volume 21	C. L. Young and P. G. T. Fogg, <i>Ammonia, Amines, Phosphine, Arsine, Stibine, Silane, Germane and Stannane in Organic Solvents</i>
Volume 22	T. Mioduski and M. Salomon, <i>Scandium, Yttrium, Lanthanum and Lanthanide Halides in Nonaqueous Solvents</i>
Volume 23	T. P. Dirkse, <i>Copper, Silver, Gold, and Zinc, Cadmium, Mercury Oxides and Hydroxides</i>
Volume 24	W. Hayduk, <i>Propane, Butane and 2-Methylpropane</i>
Volume 25	C. Hirayama, Z. Galus and C. Guminski, <i>Metals in Mercury</i>
Volume 26	M. R. Masson, H. D. Lutz and B. Engelen, <i>Sulfites, Selenites and Tellurites</i>
Volume 27/28	H. L. Clever and C. L. Young, <i>Methane</i>
Volume 29	H. L. Clever, <i>Mercury in Liquids, Compressed Gases, Molten Salts and Other Elements</i>
Volume 30	H. Miyamoto and M. Salomon, <i>Alkali Metal Halates, Ammonium Iodate and Iodic Acid</i>
Volume 31	J. Eysseltová and T. P. Dirkse, <i>Alkali Metal Orthophosphates</i>
Volume 32	P. G. T. Fogg and C. L. Young, <i>Hydrogen Sulfide, Deuterium Sulfide and Hydrogen Selenide</i>
Volume 33	P. Franzosini, <i>Molten Alkali Metal Alkanoates</i>
Volume 34	A. N. Paruta and R. Piekos, <i>4-Aminobenzenesulfonamides. Part I: Non-cyclic Substituents</i>
Volume 35	A. N. Paruta and R. Piekos, <i>4-Aminobenzenesulfonamides. Part II: 5-Membered Heterocyclic Substituents</i>
Volume 36	A. N. Paruta and R. Piekos, <i>4-Aminobenzenesulfonamides. Part III: 6-Membered Heterocyclic Substituents and Miscellaneous Systems</i>
Volume 37	D. G. Shaw, <i>Hydrocarbons with Water and Seawater. Part I: Hydrocarbons C₅ to C₇</i>
Volume 38	D. G. Shaw, <i>Hydrocarbons with Water and Seawater. Part II: Hydrocarbons C₈ to C₃₆</i>
Volume 39	C. L. Young, <i>Cumulative Index: Volumes 20–38</i>
Volume 40	J. Hala, <i>Halides, Oxyhalides and Salts of Halogen Complexes of Titanium, Zirconium, Hafnium, Vanadium, Niobium and Tantalum</i>
Volume 41	C.-Y. Chan, I. N. Lepeshkov and K. H. Khoo, <i>Alkaline Earth Metal Perchlorates</i>
